

HOW TO
UNIVERSAL

LASERS!

FRESH 26 JANUARY 2022

You are required to follow all current university guidelines for wearing masks while in the lab.

You are
responsible for
keeping our
community safe!

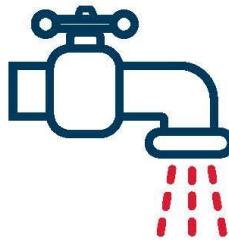

COVER

wear a mask
when required
on campus

THE GEORGE
WASHINGTON
UNIVERSITY
WASHINGTON, DC

Visit go.gwu.edu/covid19 for the latest updates and information about how the university is responding to COVID-19.

CLEAN

wash and sanitize
hands often

CONTAIN

stay home
if you're sick

NOTE

This document is NOT
a substitute for hands-on training.
Ask your teacher
or a lab tech for a tutorial.

This tutorial assumes you already have basic working knowledge of Adobe Illustrator.

If you've never worked with Illustrator before, a good place to start is to download it via Creative Cloud Desktop app (all Columbian students get this for free) and brush up on it in [LinkedIn Learning](#) (was lynda.com, also free to Columbian students). Search for courses on the more recent editions of illustrator.

The laser is quite safe to use, but it
is powerful; using it requires your
full caution, attention and respect.

Some rules of the road:

Rules of the road

No food or drink in the lab.

Rules of the road

Clean up after yourself.

If you brought it in with you, take it back out. Store materials and projects in your locker, in your studio, or someplace designated by your faculty. Keep the lab clean and uncluttered.

Rules of the road

If you're not sure...

DON'T!

Get the help you need,
even if it means waiting.

Rules of the road

Don't bypass or disable any
of the safety features.

These are Class 4 lasers which can instantly
burn or blind you, even from reflections.

Rules of the road

Work in pairs. It always helps to have a second set of eyes in case you miss a detail.

Rules of the road

**NEVER LEAVE THE LASER
UNATTENDED WHILE CUTTING!**

If your material catches fire, the
laser will shut down, but that
doesn't put the fire out...

Know where the fire extinguisher is located.

This is critical for the lasers. As you enter the room, it's right next to the door. Generally the on-duty lab tech will decide whether the fire extinguisher is called for, but you should know where it is.

Know where the first aid kit is. If an emergency occurs:

Life-threatening:

call 911

Physical safety:

UPD 202-994-6111 (46111 from university phones)

Toxic spill:

Health & Safety 202-994-4347 (44347 from university phones)

Materials

The school will be providing common materials for class projects. This ensures we are only using safe, appropriate materials for the lab.

If you are working on a personal project outside of a class and need to source safe materials, contact Devin (PaceD@gwu.edu)

The rule of thumb: if you can burn it with a cigarette lighter, it can be cut it with the laser (but that doesn't mean it's safe). All materials need to be approved by Devin (PaceD@gwu.edu) before you use them on the laser!!!!

GOOD

Material	Raster Engraving	Vector Engraving	Vector Cut
Corrugated Cardboard	OK	OK	OK
Uncoated Paper	OK	OK	OK
Chipboard/Matboard/Museum board	OK	OK	OK
Resale Acrylic	OK	OK	OK
Interior Plywood	OK	OK	OK
Balsa Wood / Basswood	OK	OK	OK
Hardwoods (Domestic Only)	OK	OK	OK
Arries Board (Resale MDF)	OK	OK	OK
Masonite	OK	OK	OK
Resale Cork	OK	OK	OK
Resale Vegetable tanned leather	OK	OK	OK
Resale Muslin	OK	OK	OK
Unmounted Linoleum	OK	OK	OK

BAD

Material	Banned Reason
PETG, PET	Along with other emissions, is known to emit Benzene which is known to cause cancer.
Polystyrene	Known to emit styrene fumes.
ABS	Emits cyanide gas and tends to melt.
PVC	Emits chlorine gas during a cut.
Bending Plywood	Bends into the path of the laser carriage during operation.
Tropical Hardwoods	A lot of tropical hardwoods have toxins in the wood.
Corian	Creates a fine grit inside the laser bed and will grind down equipment
Casting Wax	Melts a lot.
Nylon	Emits toxic fumes.
Vinyl	Emits chlorine gas during a cut
Delrin	Along with other emissions, is known to emit Benzene which is known to cause cancer.
Foamcore	Foamcore is an expanded polystyrene and is known to emit styrene fumes when cut.

Bring extra material for testing.

Especially if you are new to the laser, or are trying a material you've never used before, it may take some trial and error to get the settings right.

Oversized material for the laser?
Cut it down to 18" x 24" BEFORE
you bring it into the lab.

This includes cardboard, chipboard, wood,
EVERYTHING. Not trained in the woodshop?
The woodshop techs are happy to train you
OR cut your materials down for you.

What about glass and metal? Our laser isn't powerful enough to cut metal,* but can mark metal using a special compound applied to the surface. It can't cut glass either, but can engrave it by creating micro-fractures.

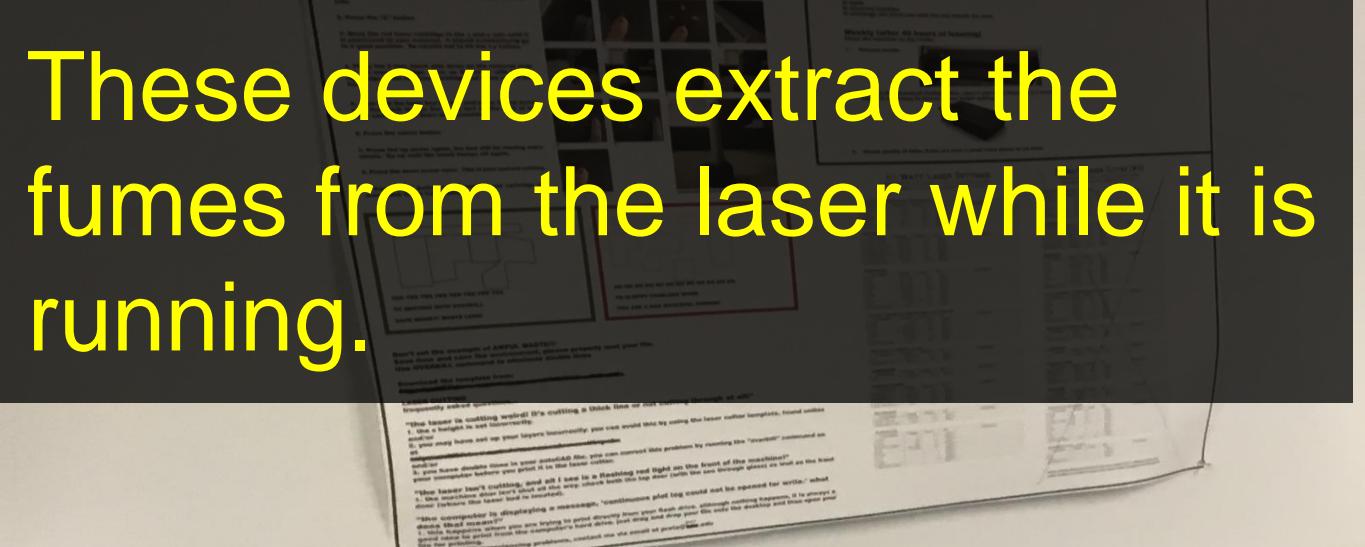

*There are caveats to both of these, but beyond the scope of this tutorial.

Not sure?

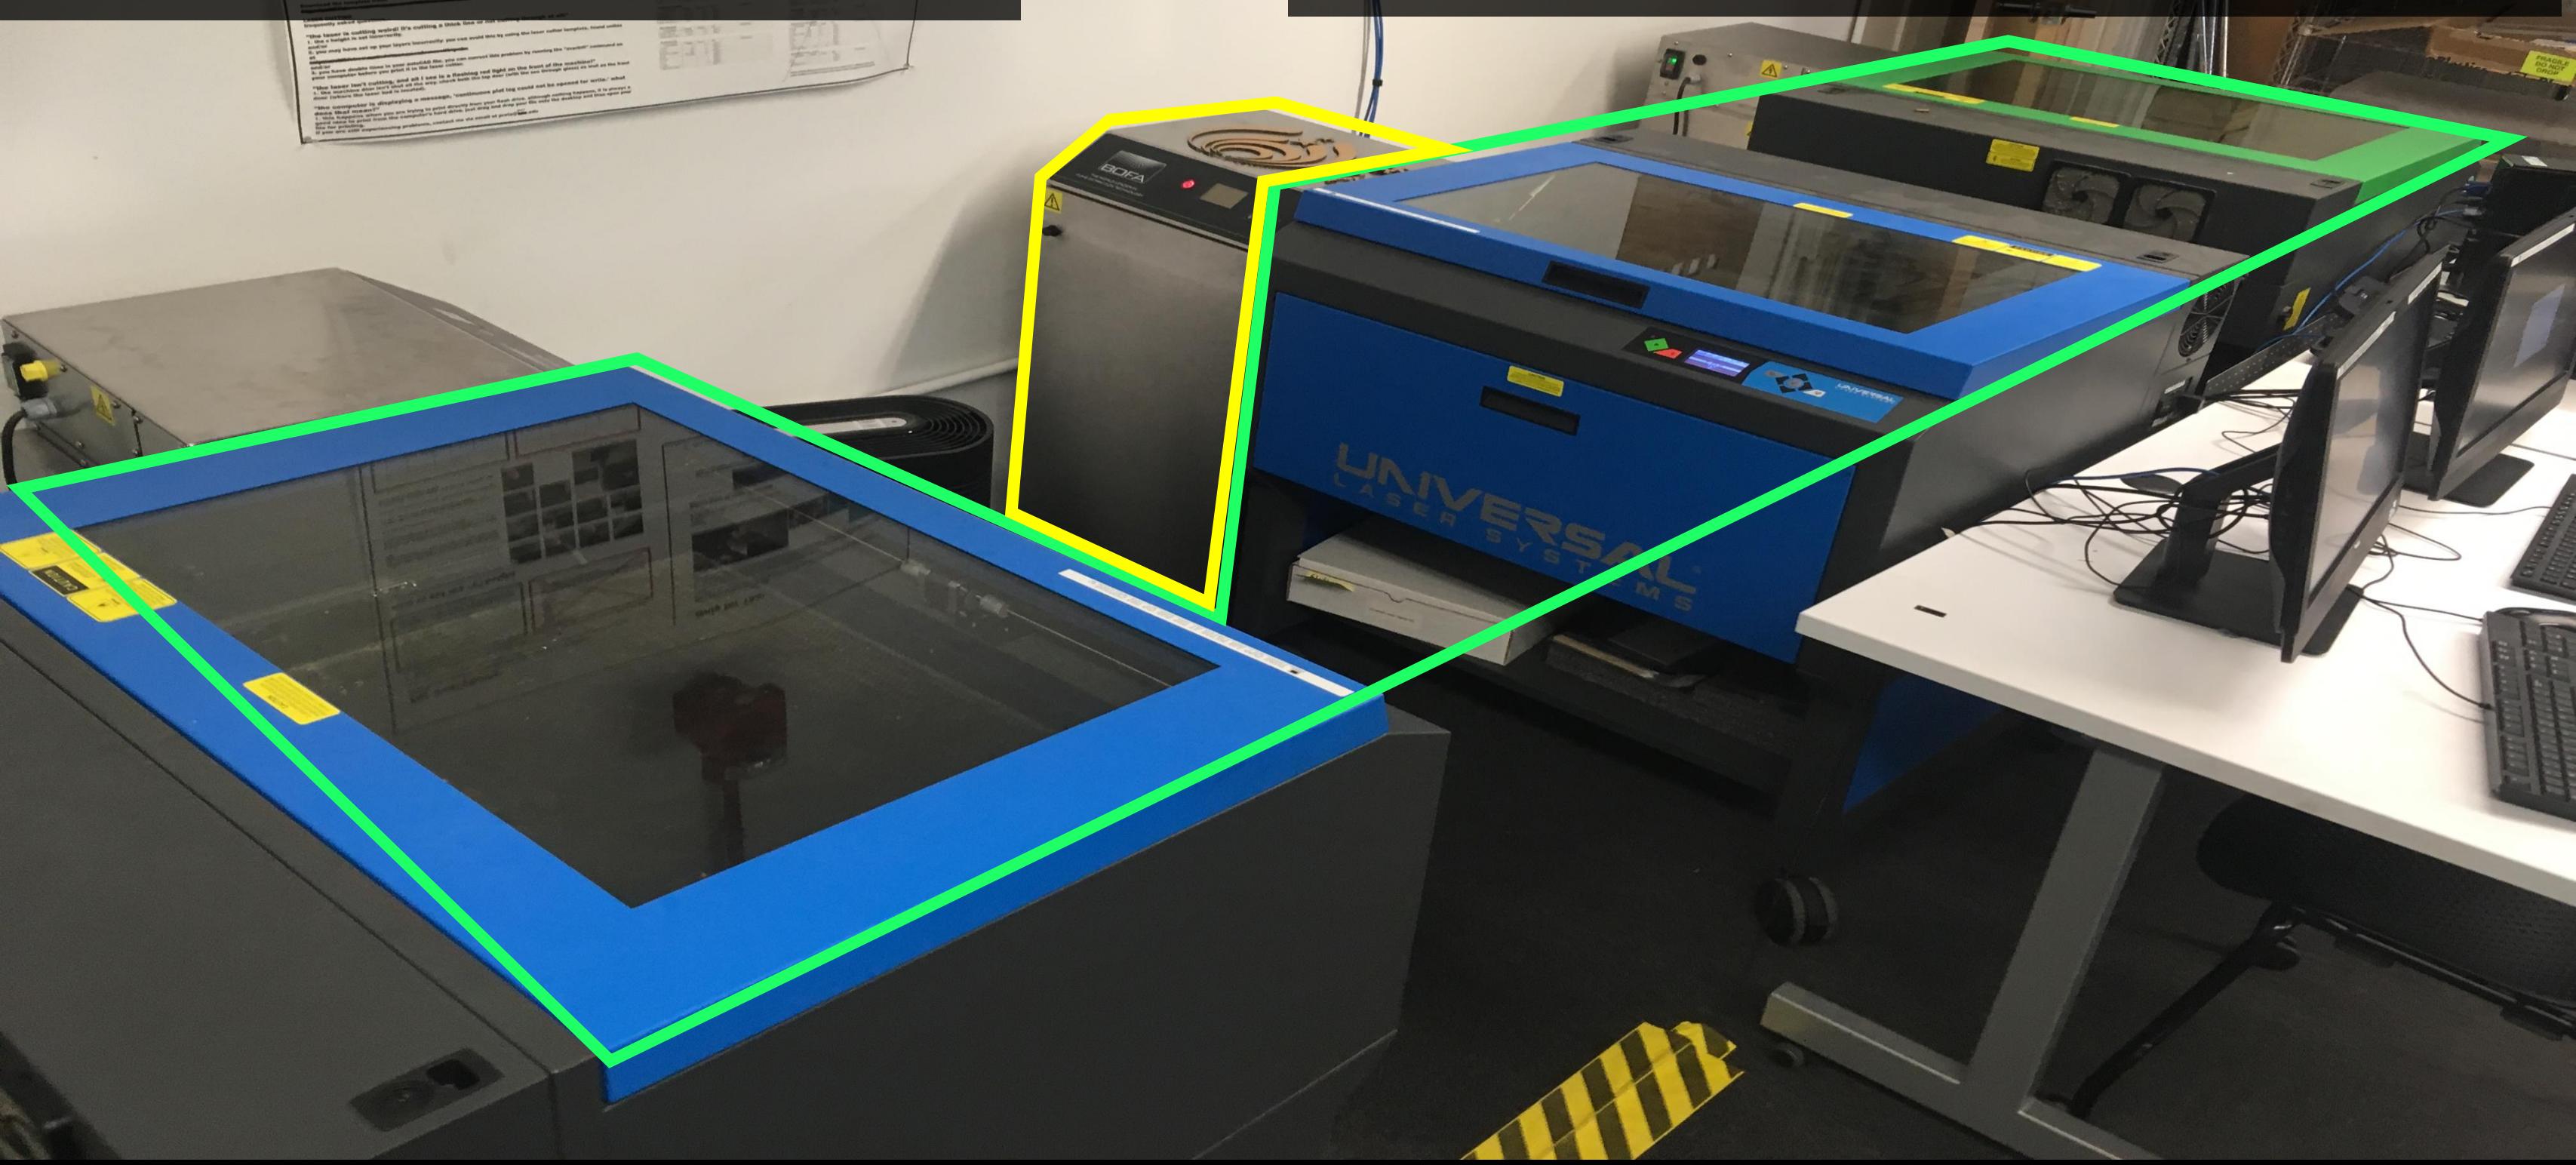

Ask your instructor, the lab tech, or
contact Devin (PaceD@gwu.edu).

the laser stations

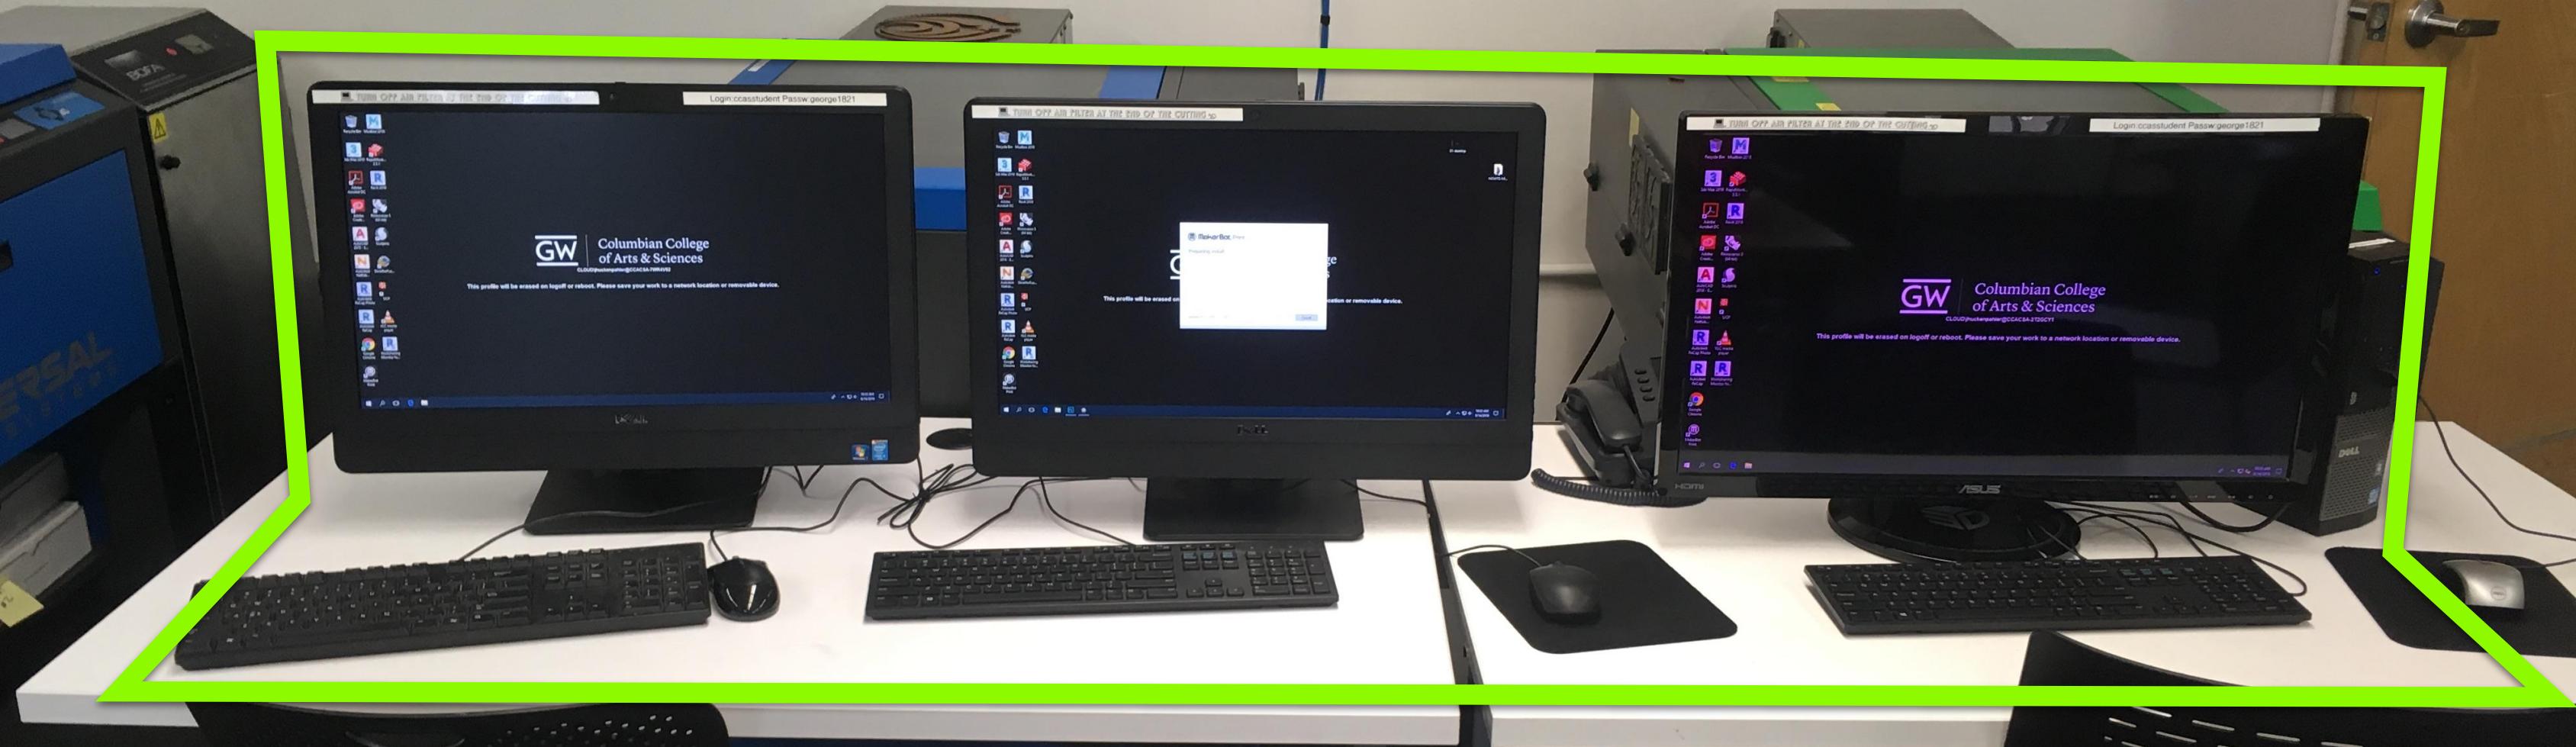

These devices extract the fumes from the laser while it is running.

These are the lasers. Two are newer, and slightly more powerful, but all three work the same way.

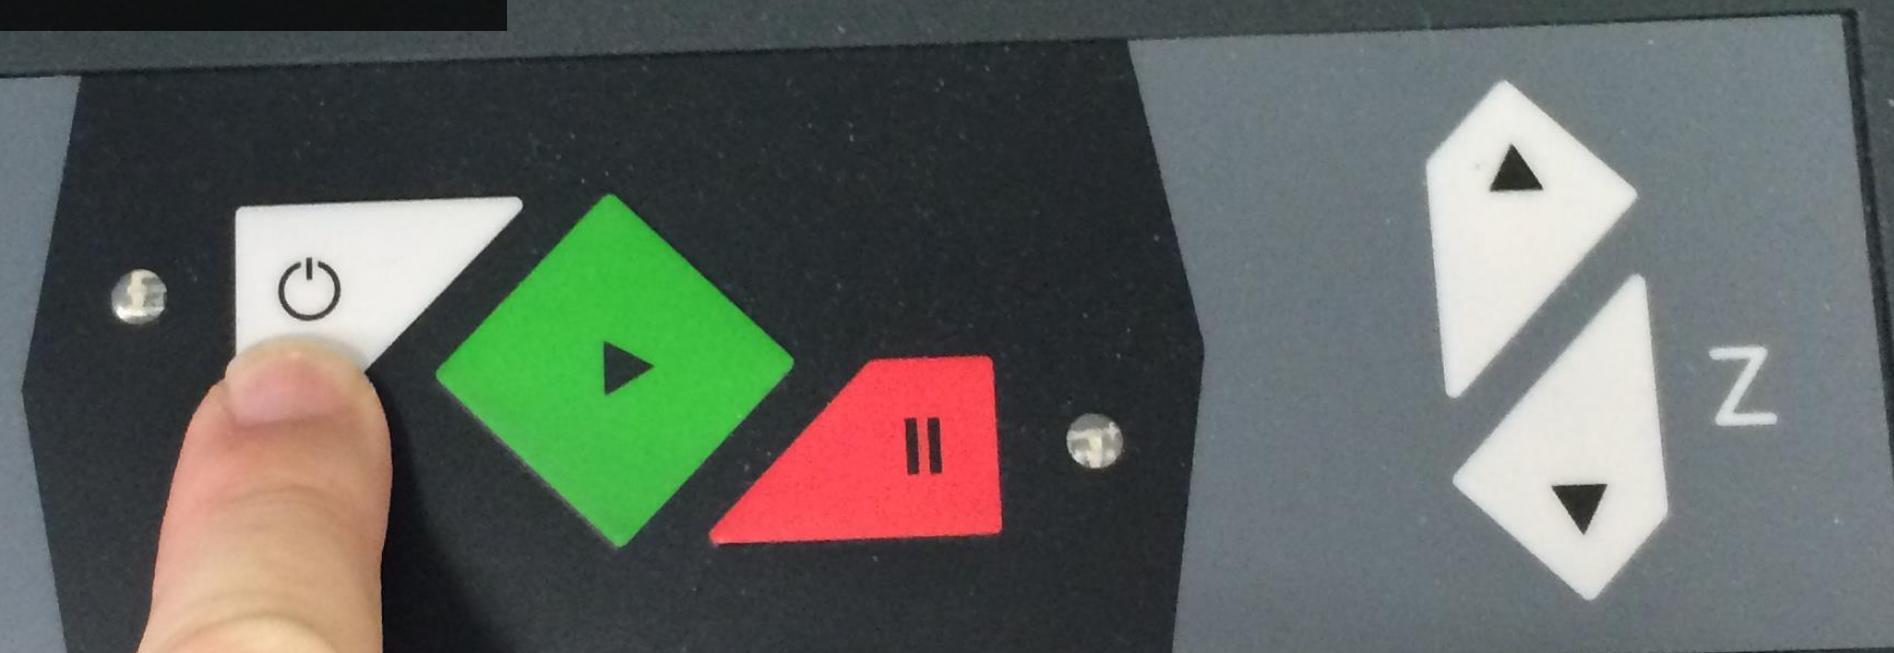

These three computers have the software for the laser; they are the only ones that can send jobs.

Prep your files on other machines,
not on the computers connected to
the lasers. You should be ready to
open a finished file, send to the
laser, and jump off when done so
you're not holding up other people.

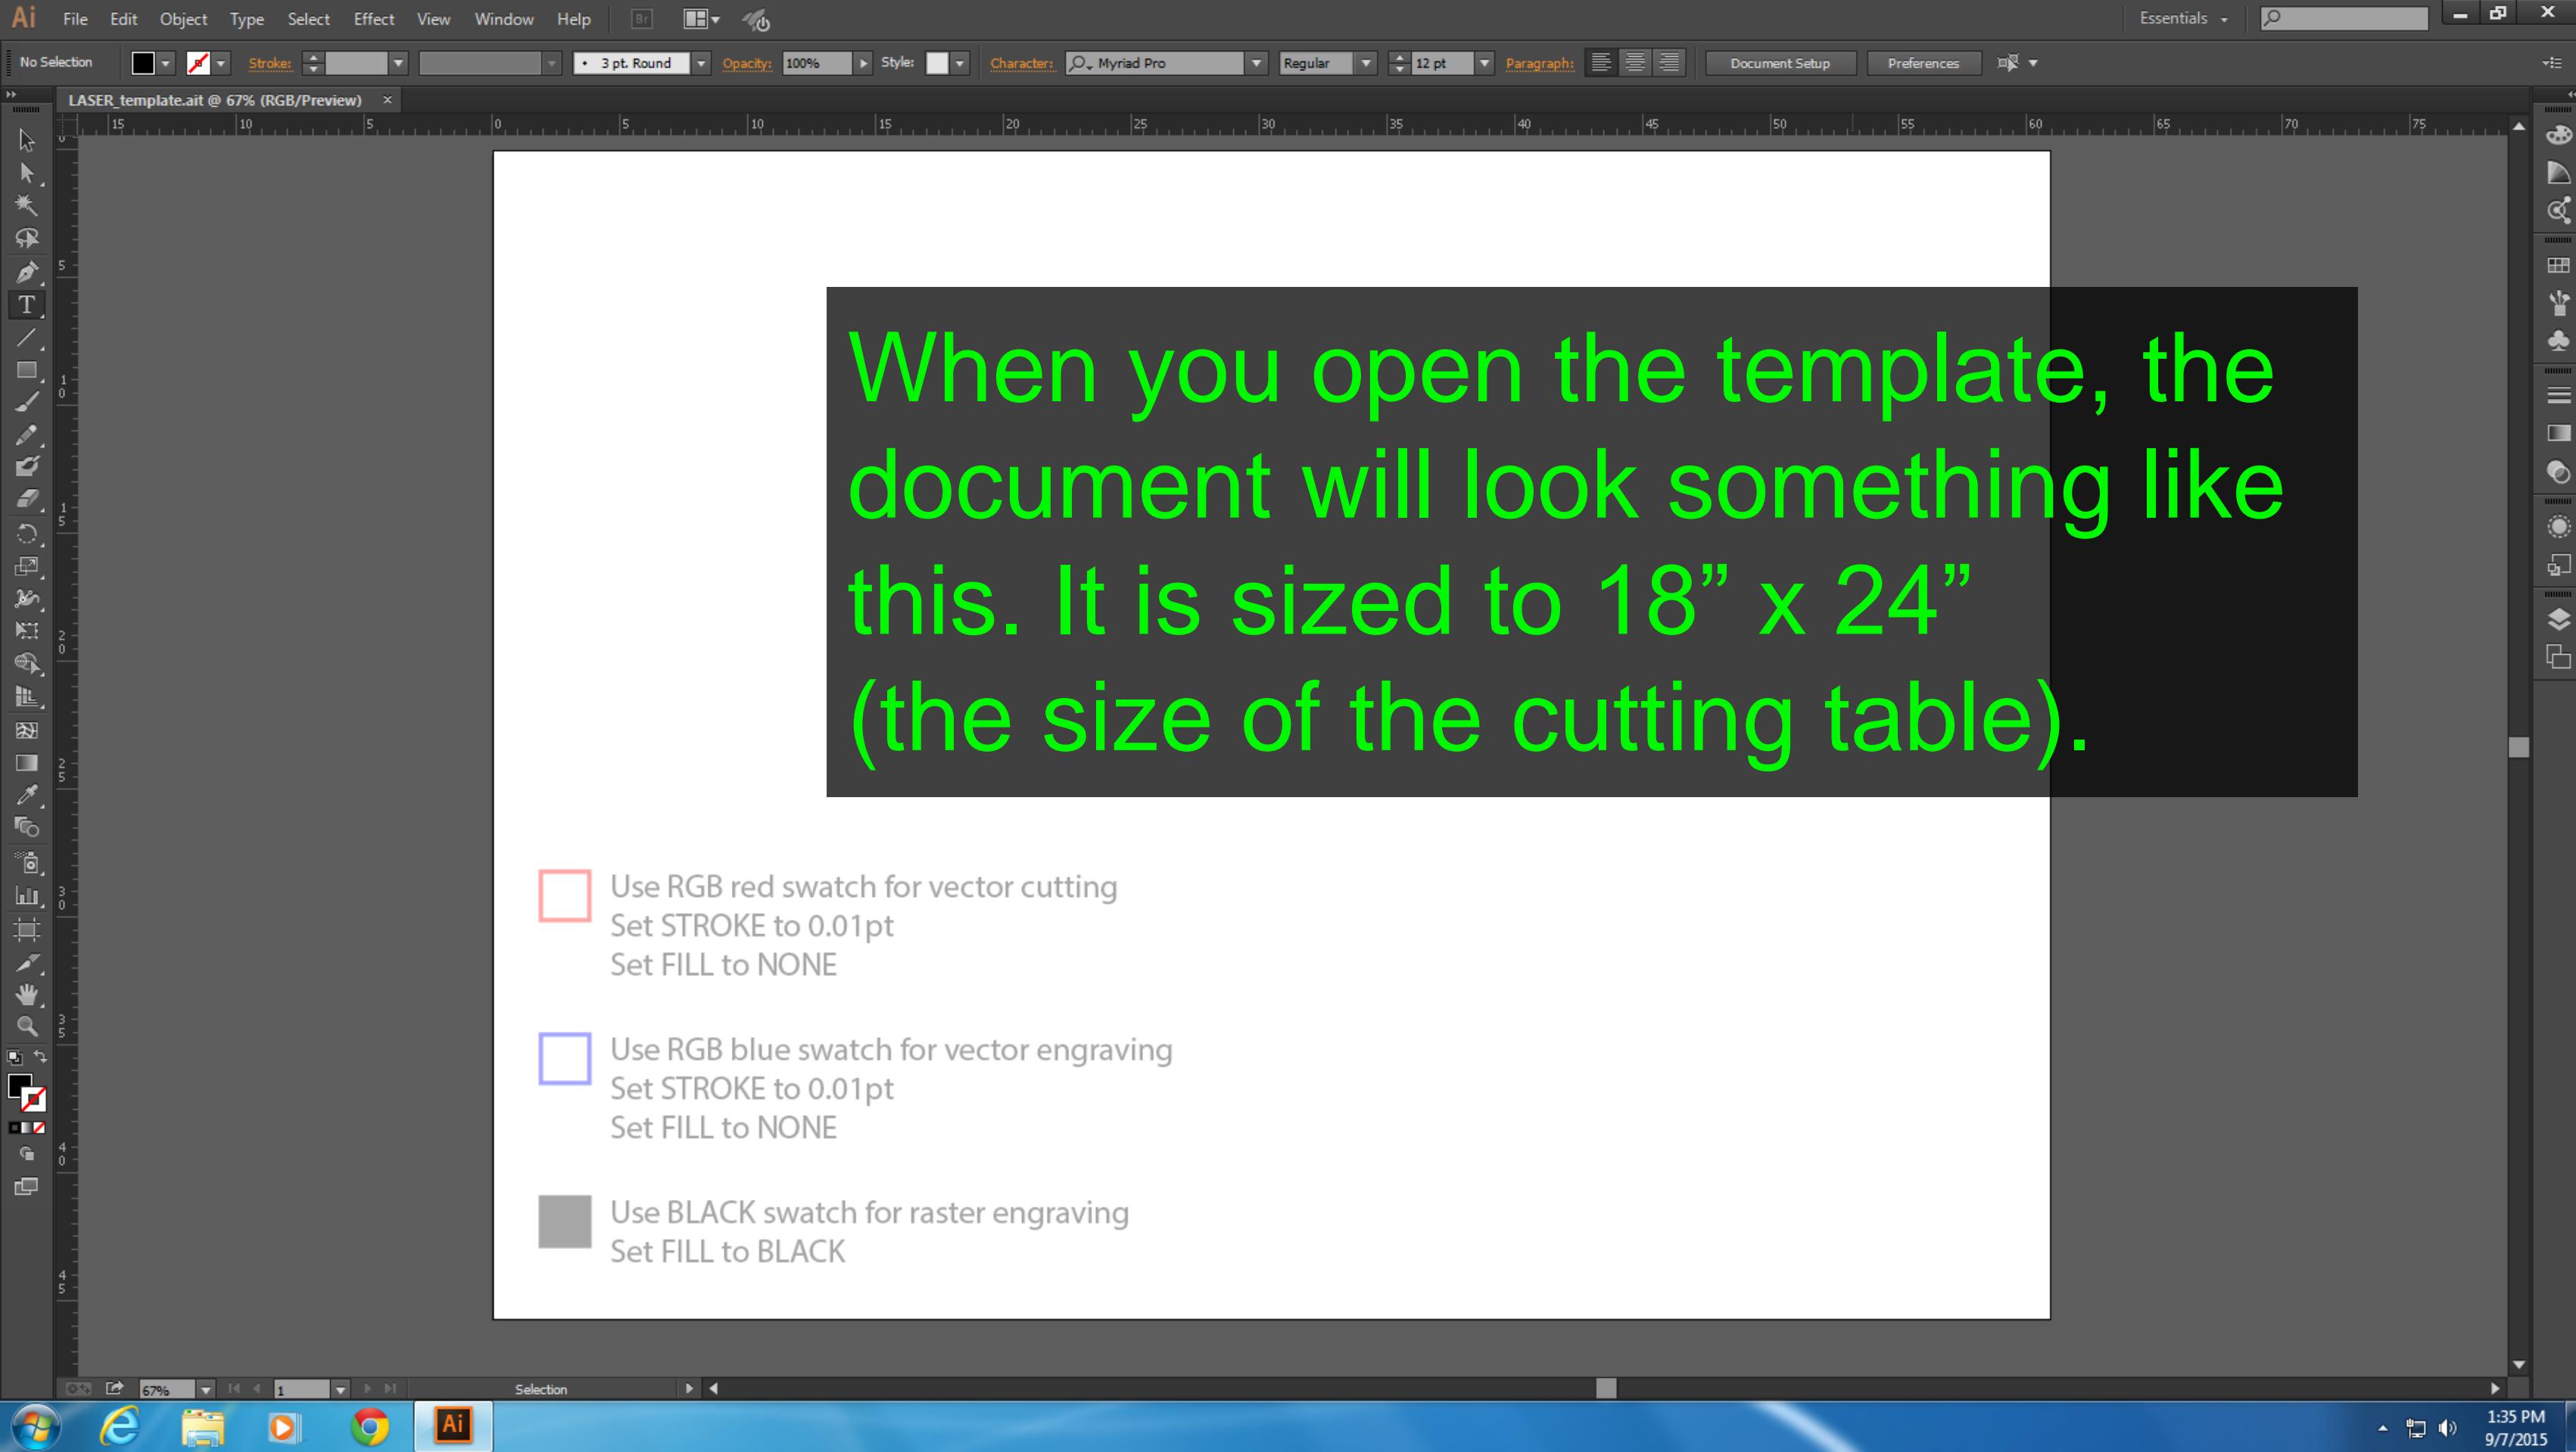

Workflow

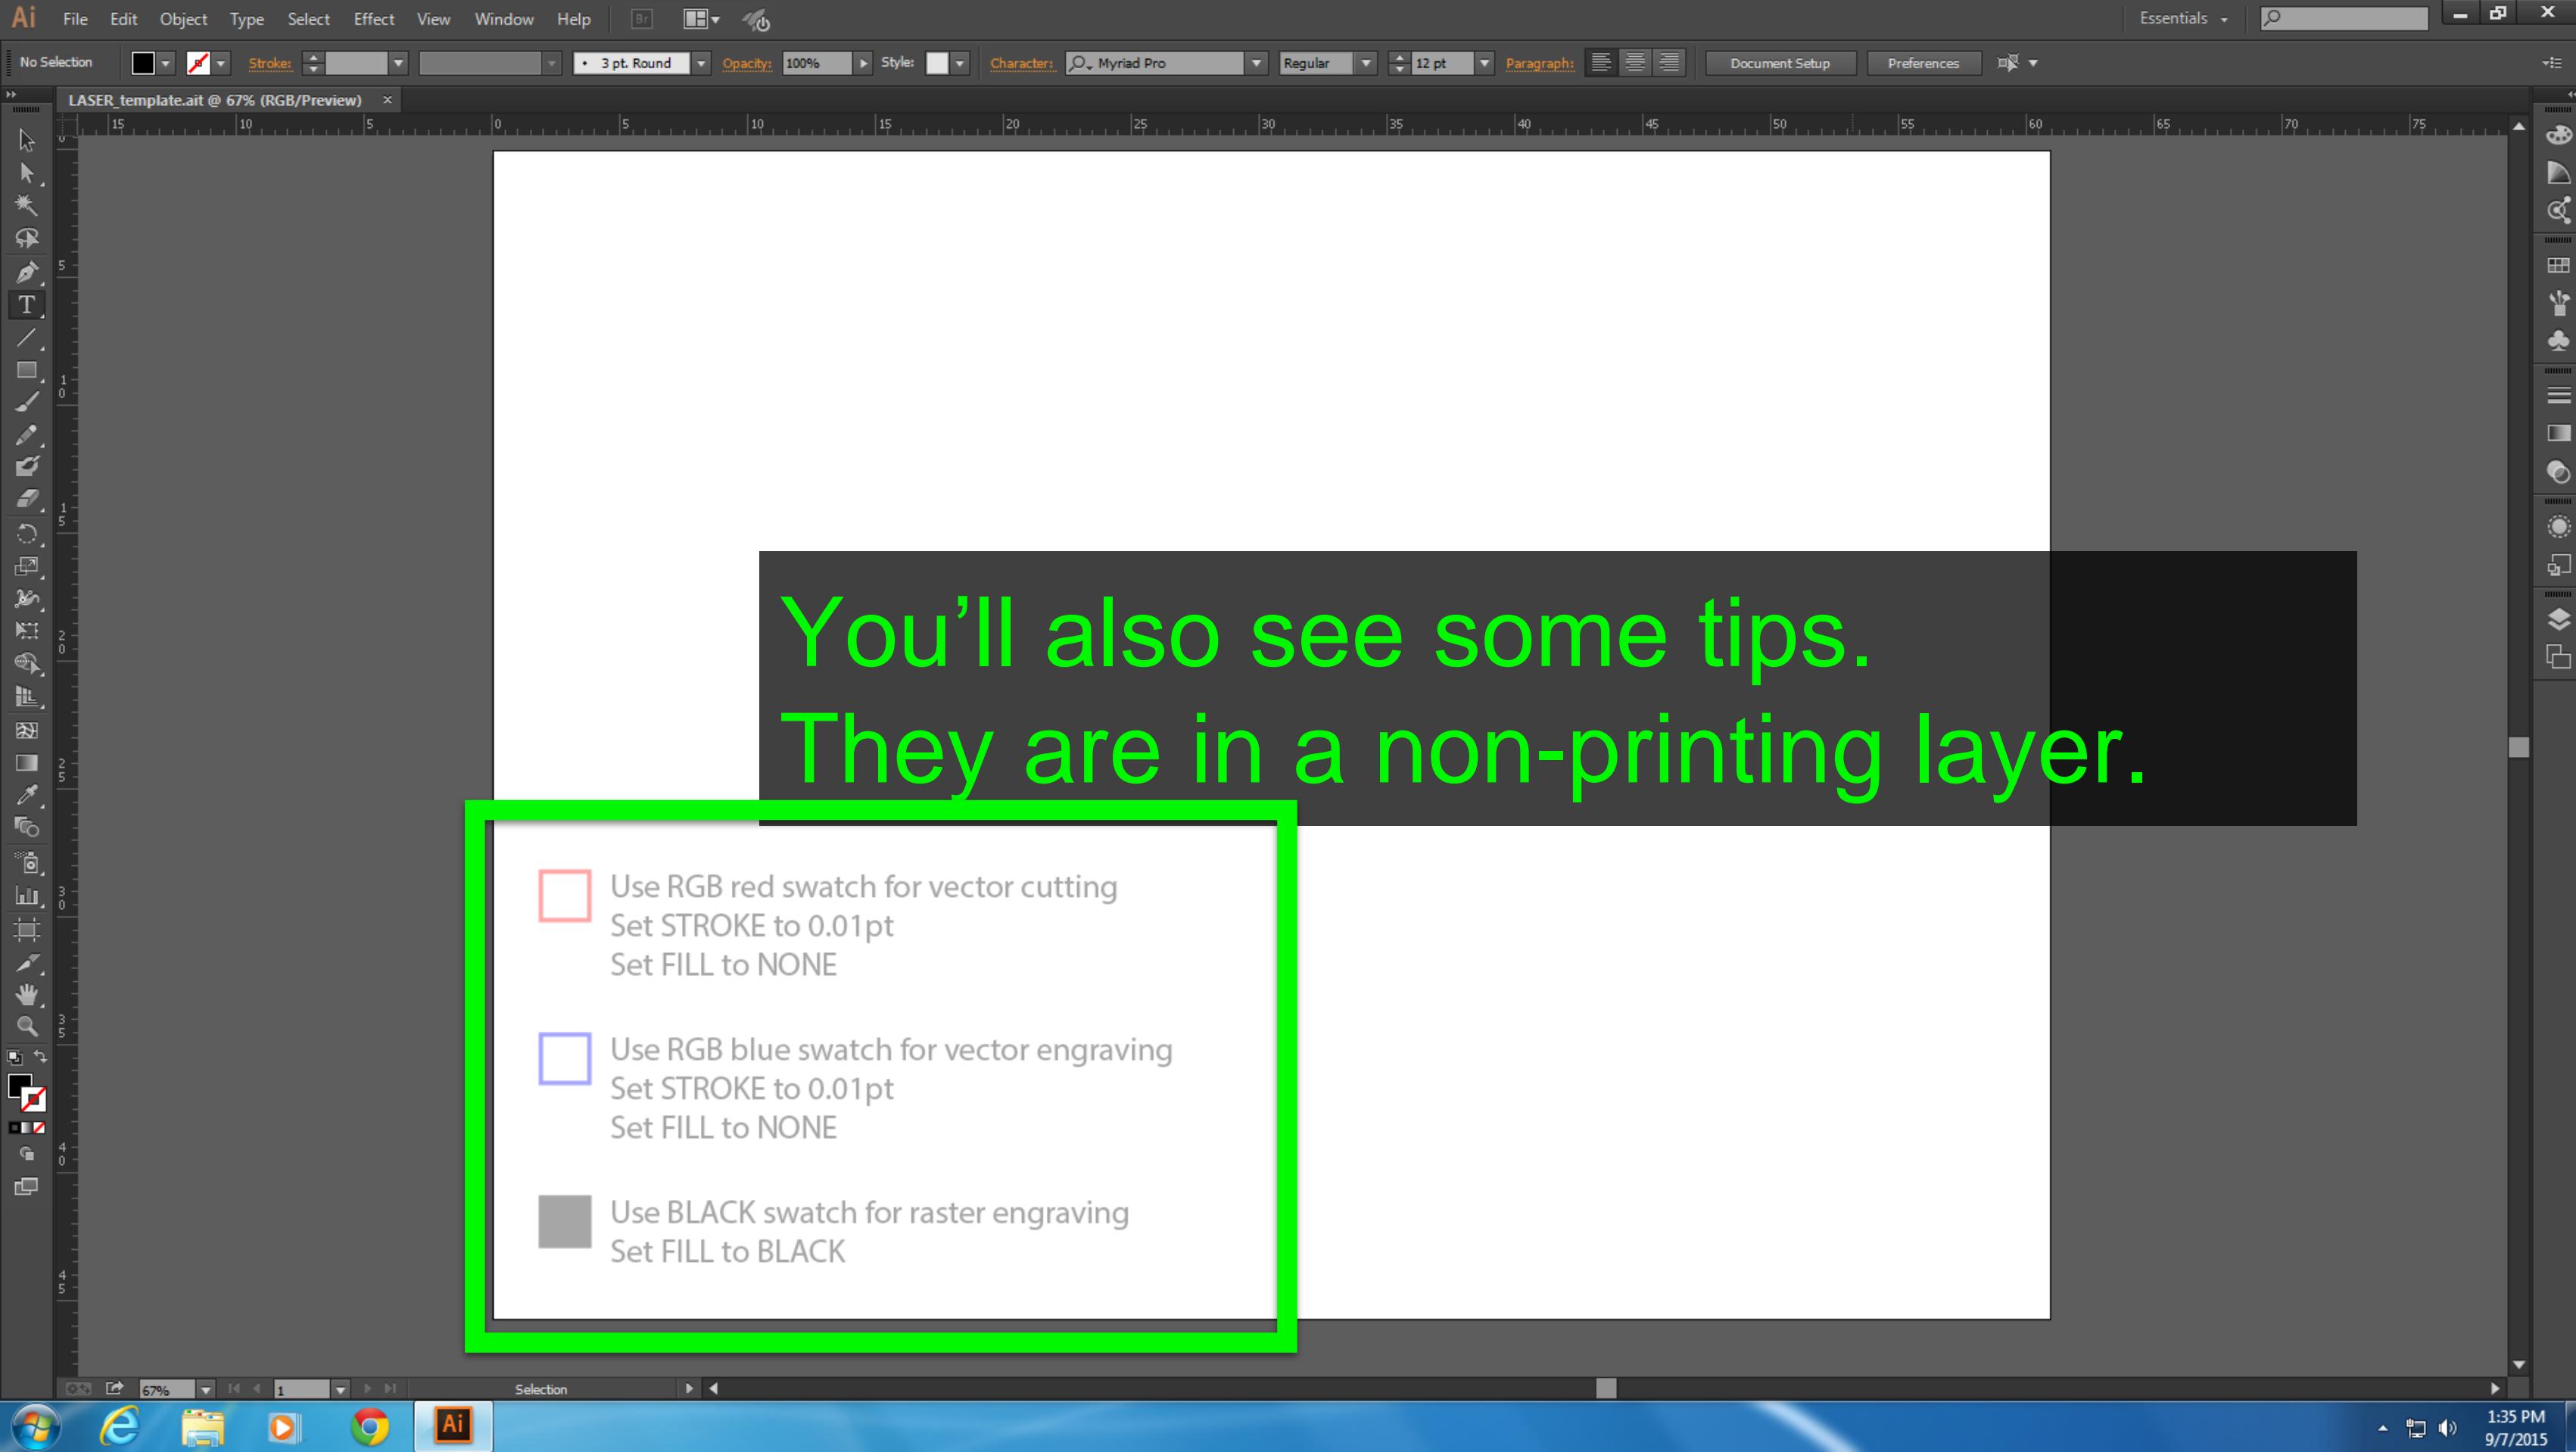

Power on the laser if it's not already on.

For general use, it's easiest to print from **Adobe Illustrator**. We've created an Illustrator **template file** that's set up to work with the laser. The template should be on the desktop. Ask a lab tech if you need help.

[Https://go.gwu.edu/csadlasertemplate](https://go.gwu.edu/csadlasertemplate)

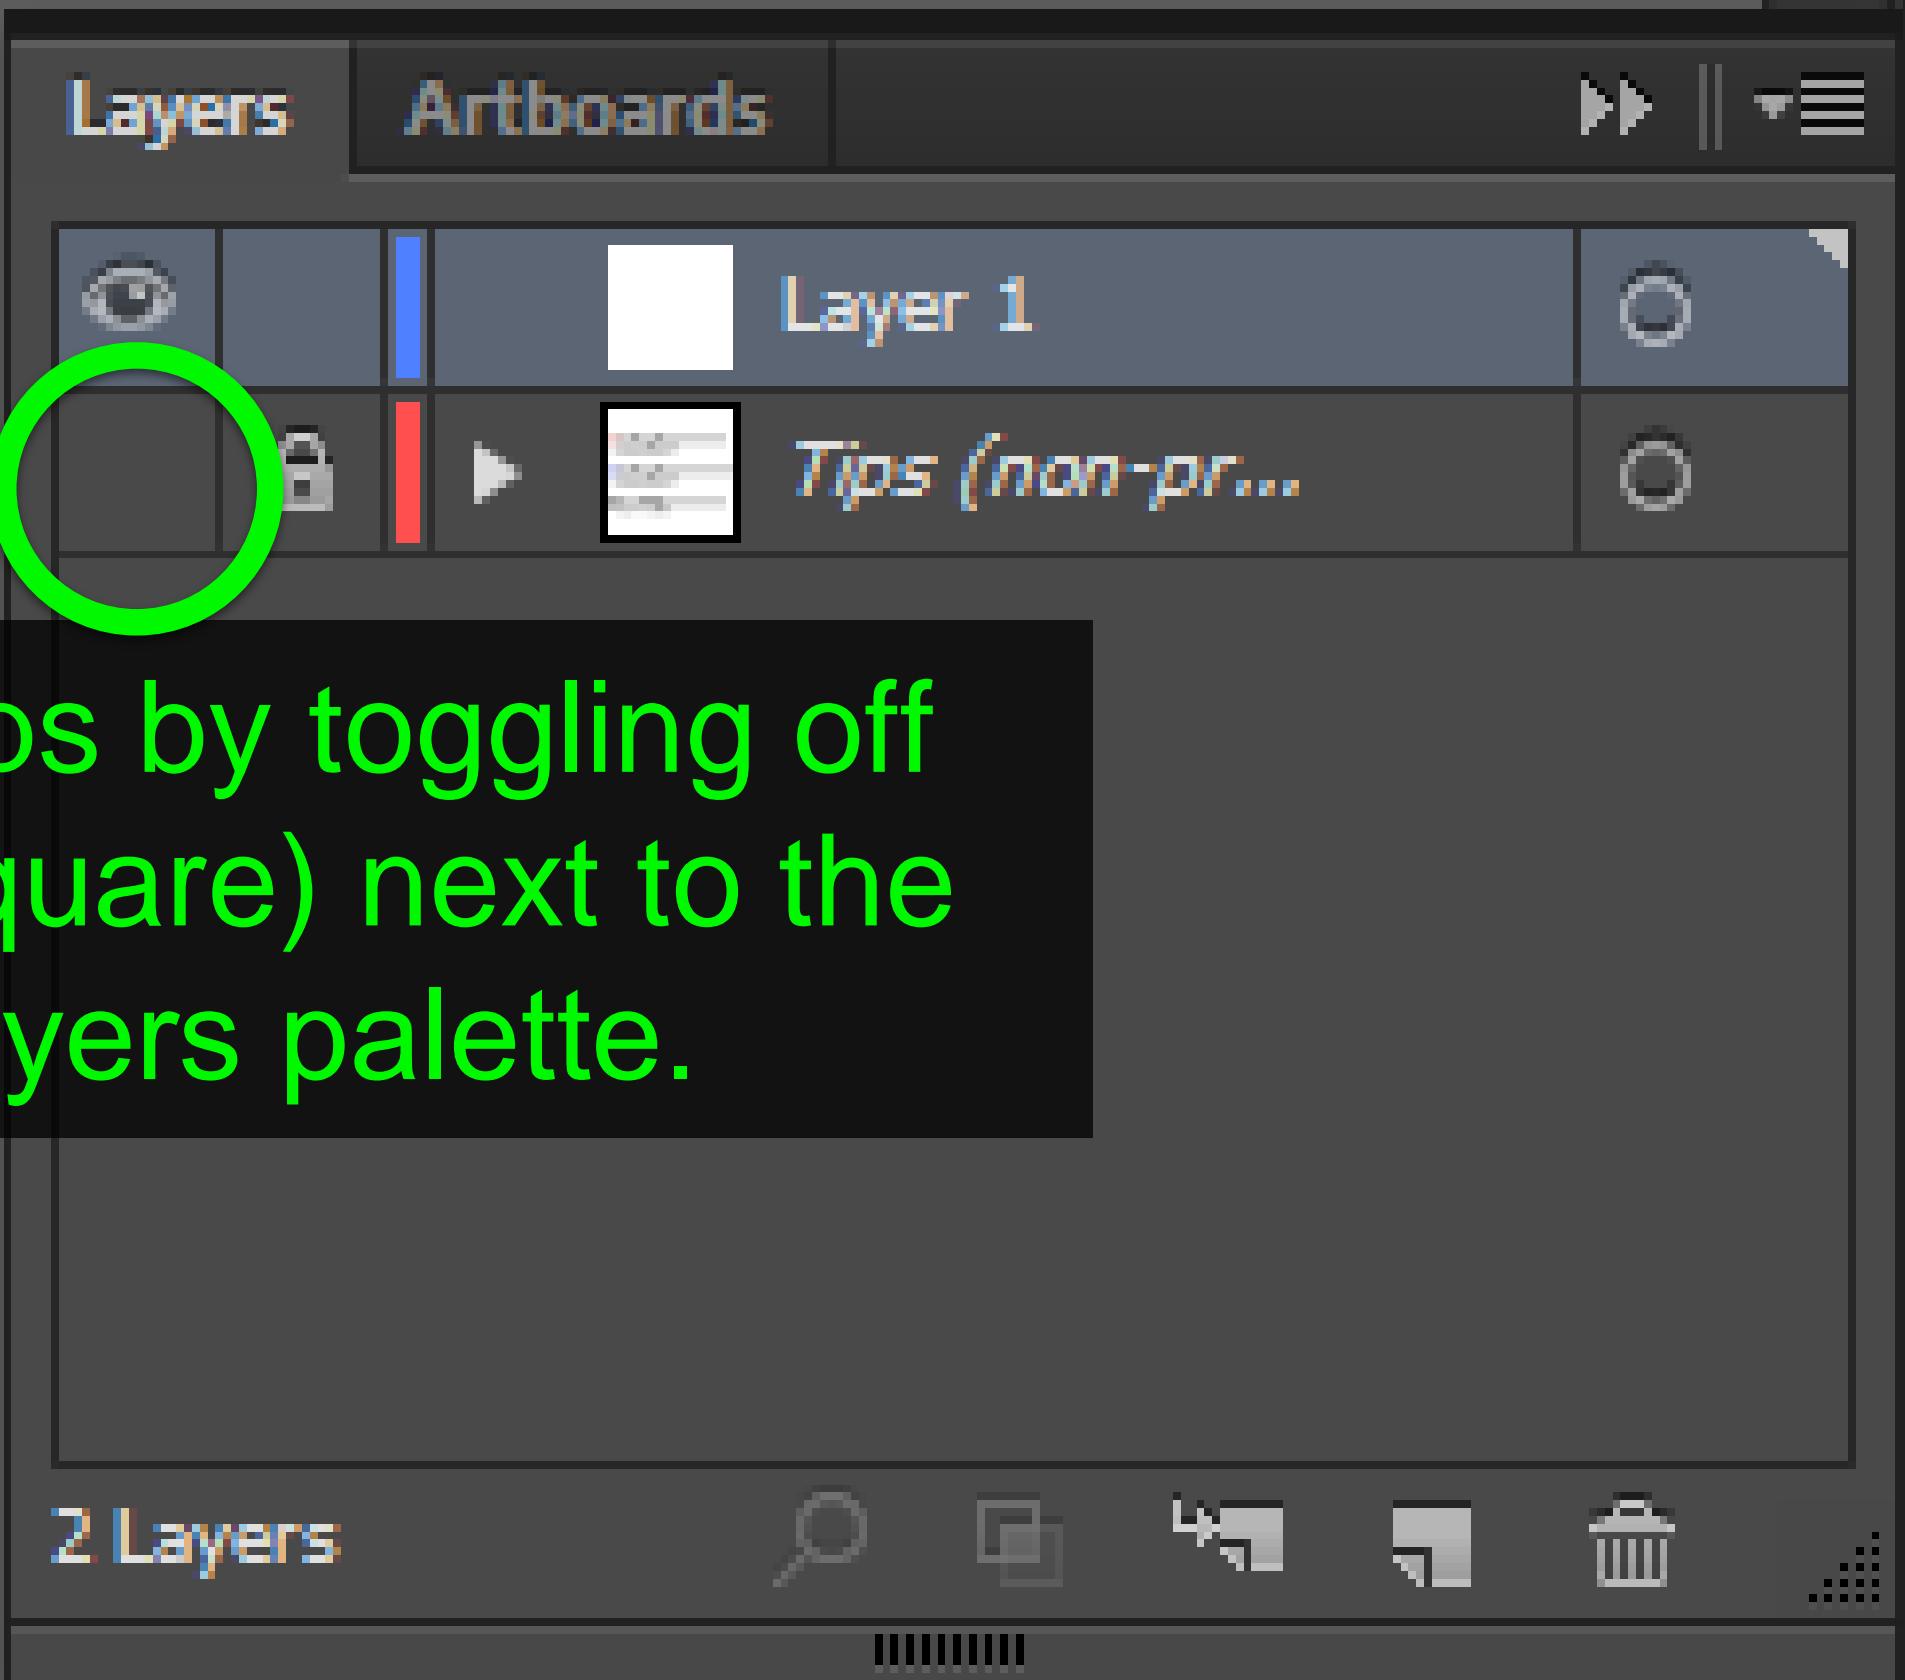

Use RGB red swatch for vector cutting
Set STROKE to 0.01pt
Set FILL to NONE

Use RGB blue swatch for vector engraving
Set STROKE to 0.01pt
Set FILL to NONE

Use BLACK swatch for raster engraving
Set FILL to BLACK

The tips let you know which specific colors tell the laser to perform specific functions. These colors are very important. The whole document needs to be set to RGB (which the template is).

You can hide the tips by toggling off the 'view' icon (a square) next to the 'Tips' layer in the layers palette.

The laser can do
three basic things:

vector cut

vector engrave

raster engrave

If you want to **cut clean through a material**, you use vector art to specify a path that the laser will follow. Vector art is typically created in programs like Adobe Illustrator.

If you want a clean hairline that is engraved on the material, but not cutting all the way through, you will vector engrave. Again, you are specifying a path that the laser will follow using vector art.

If you want to mark a material with anything other than a hairline without cutting through, you will raster engrave. Any vector art that has a fill, a stroke greater than 0.01pt, or raster art (anything with pixels) will raster engrave.)

Let's see all three in action...

Stroke:

1 pt

Uniform

Basic

Opacity:

100%

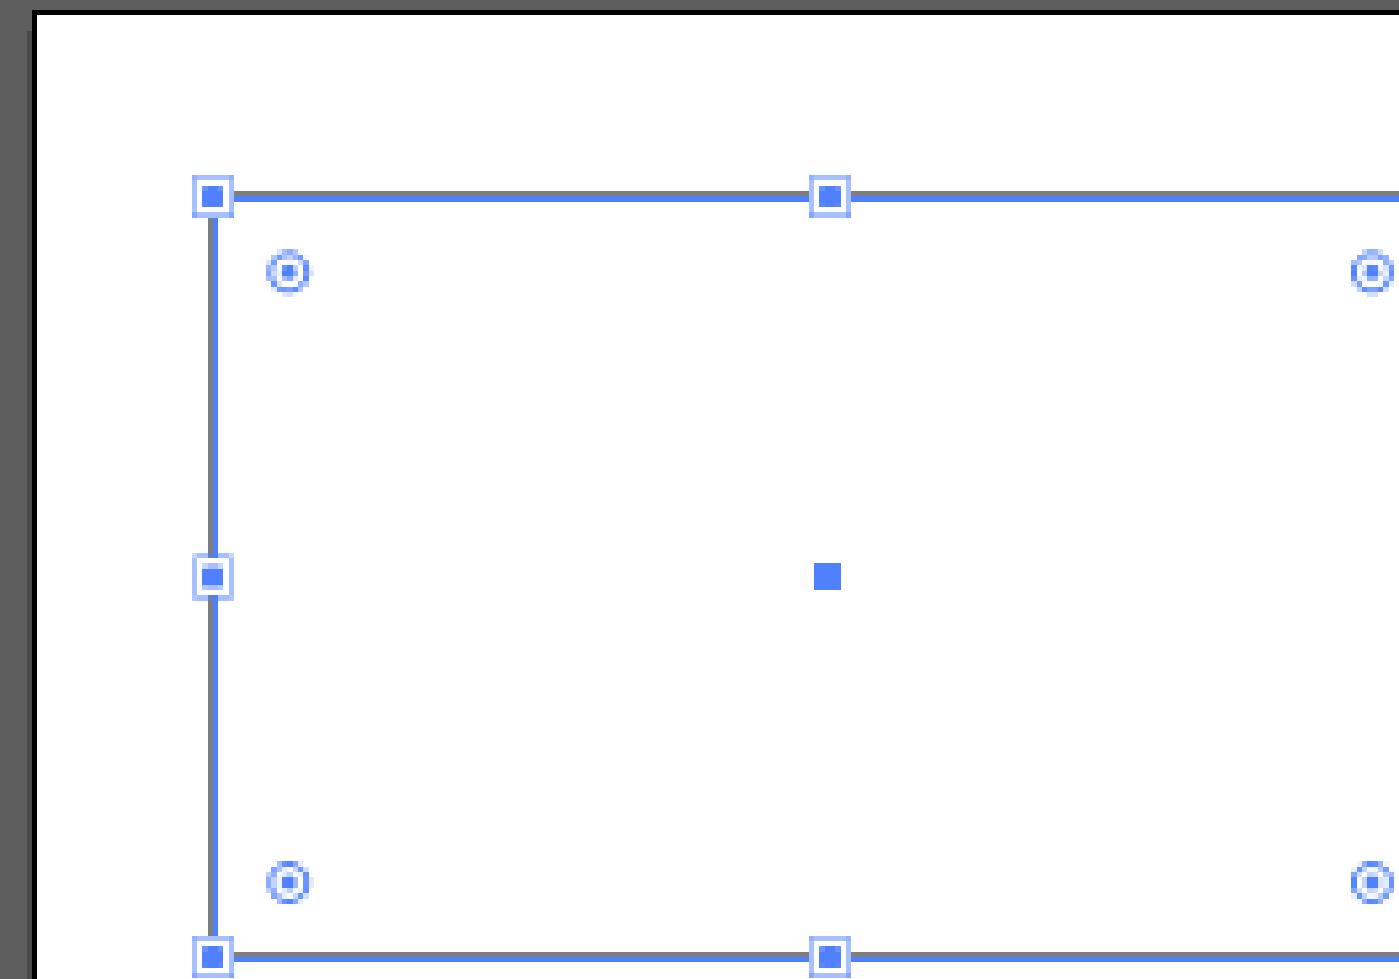

Style:

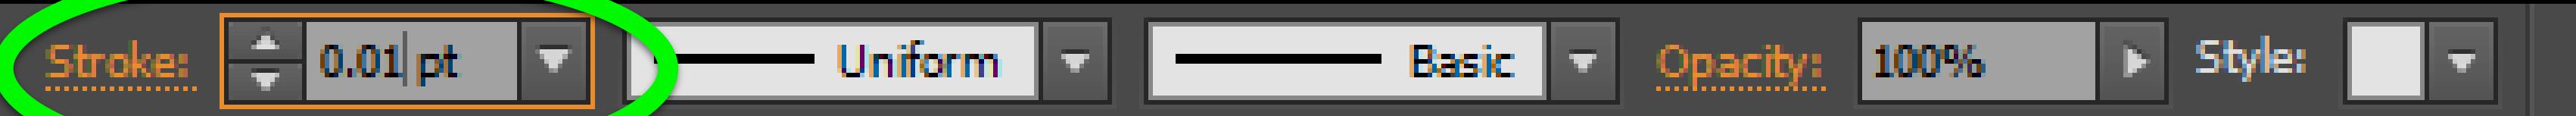

Shape:

3/Preview) X

10 5 0 5 10 15 20

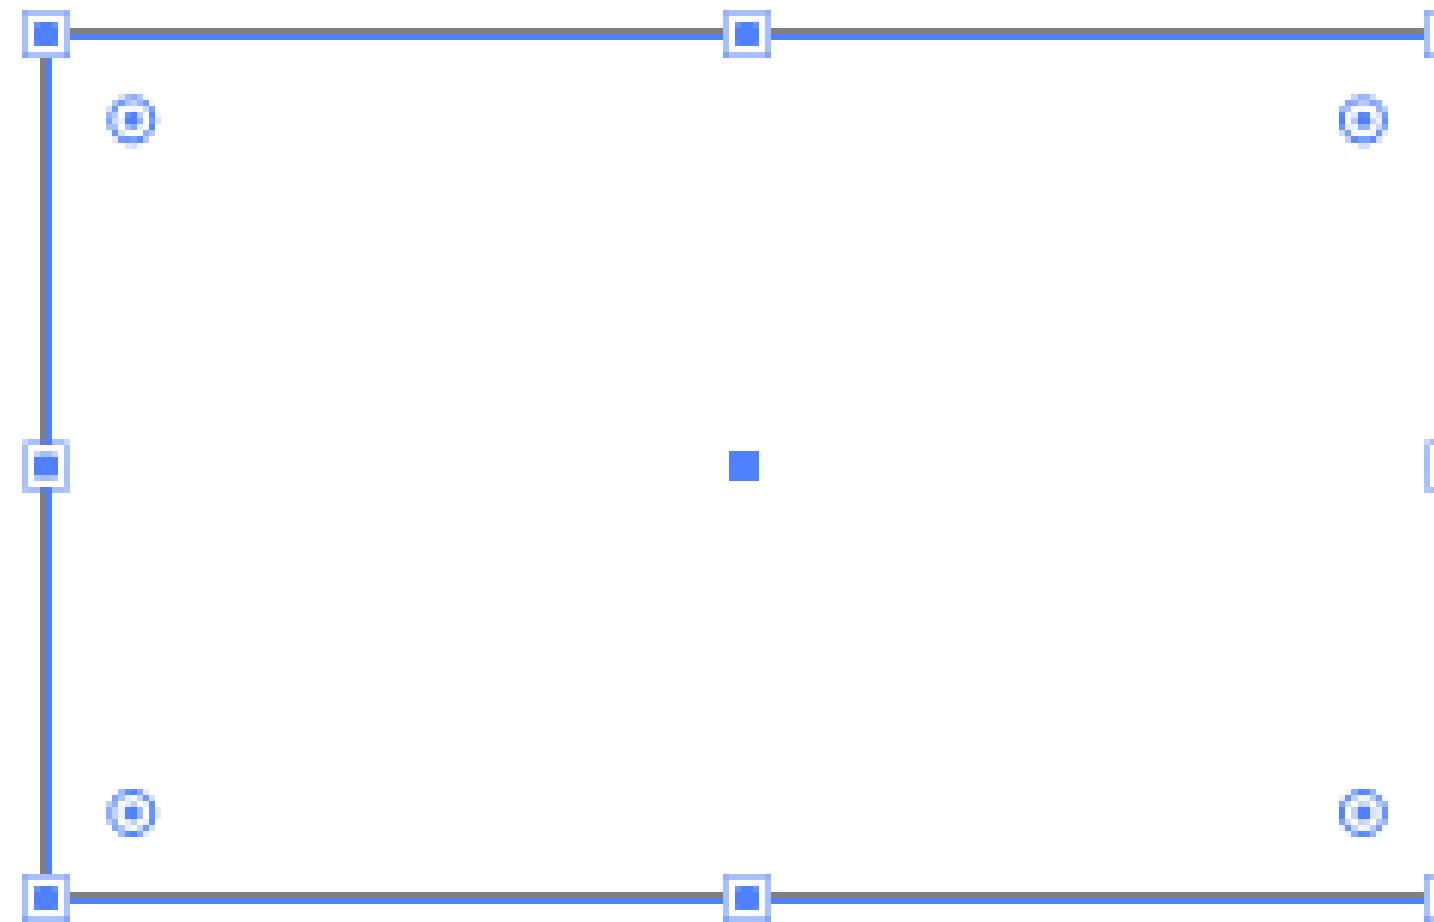

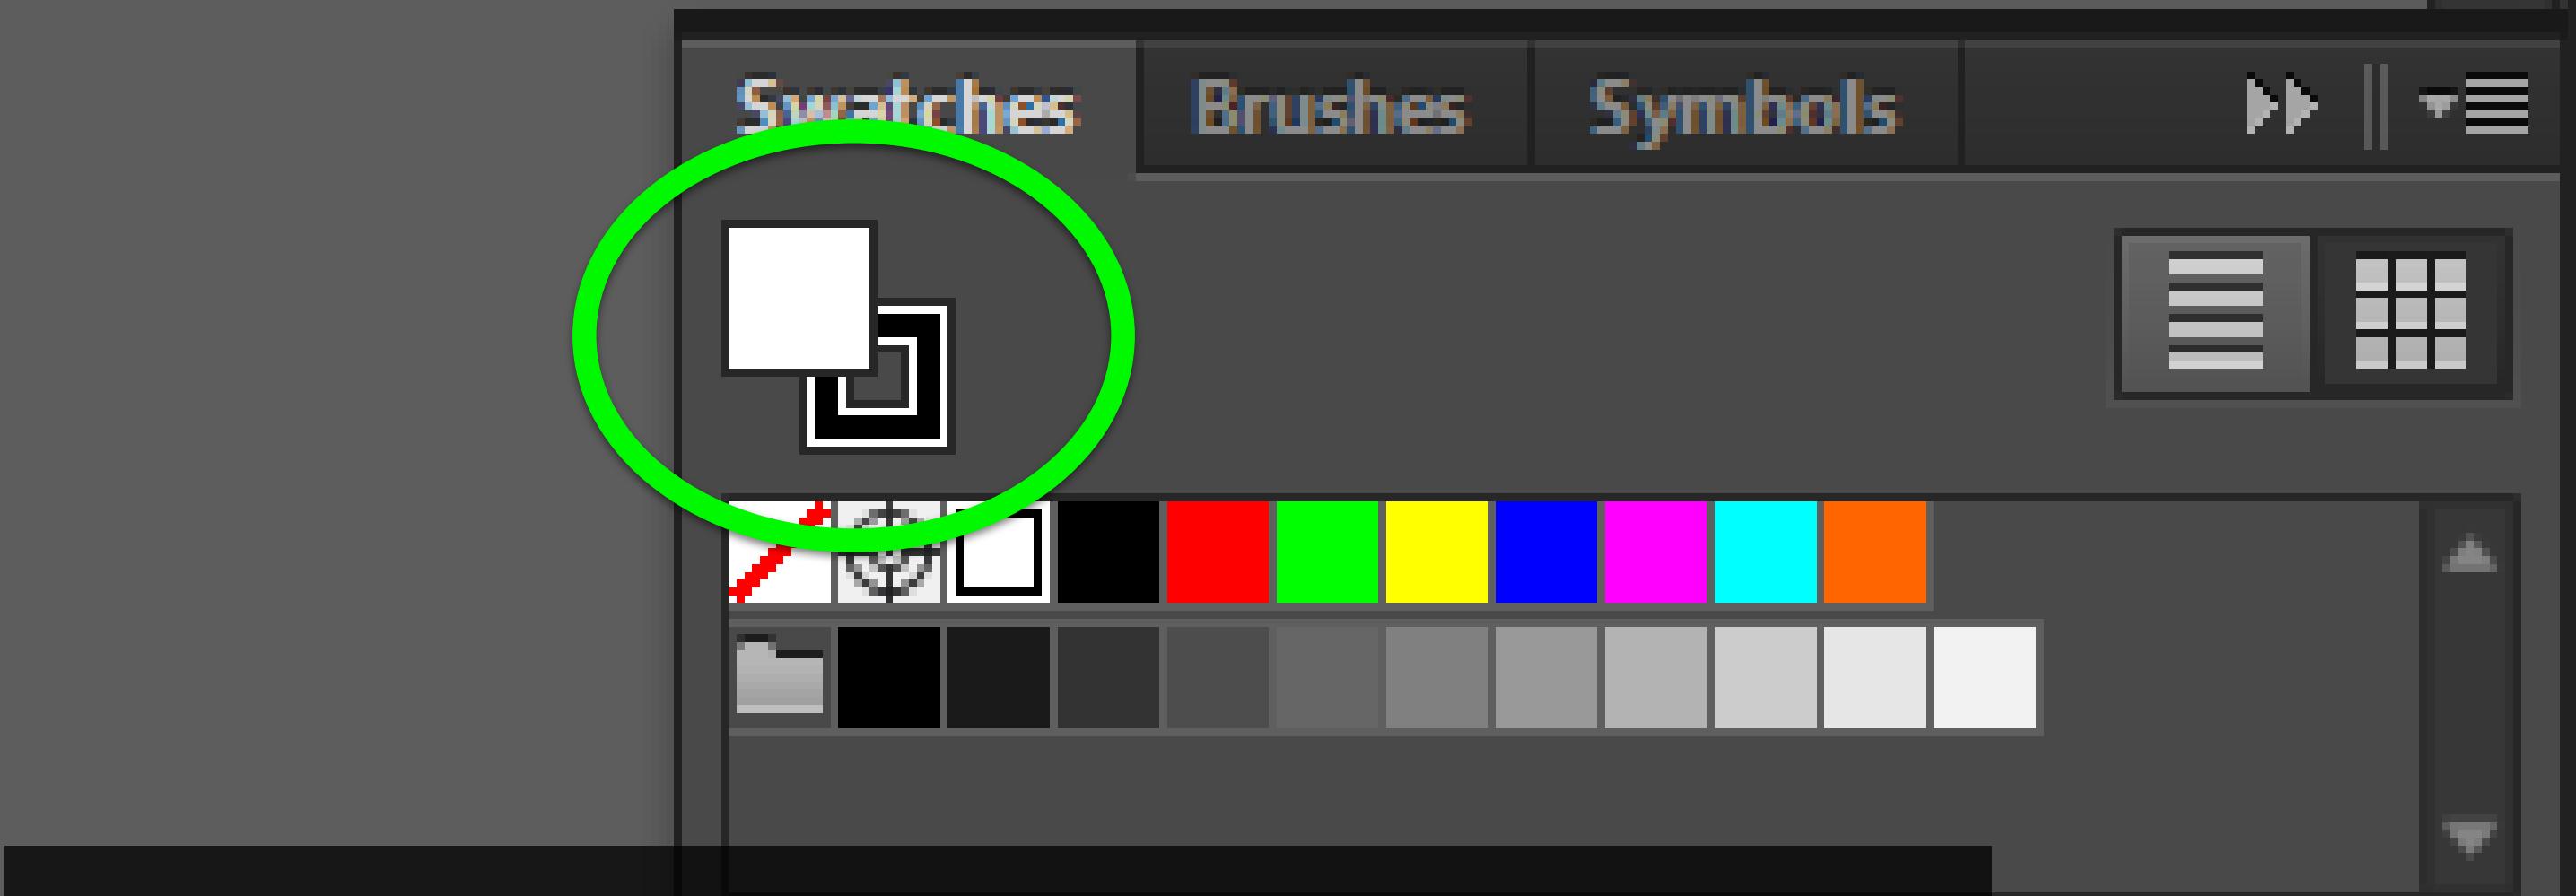

I'll start by drawing a rectangle...

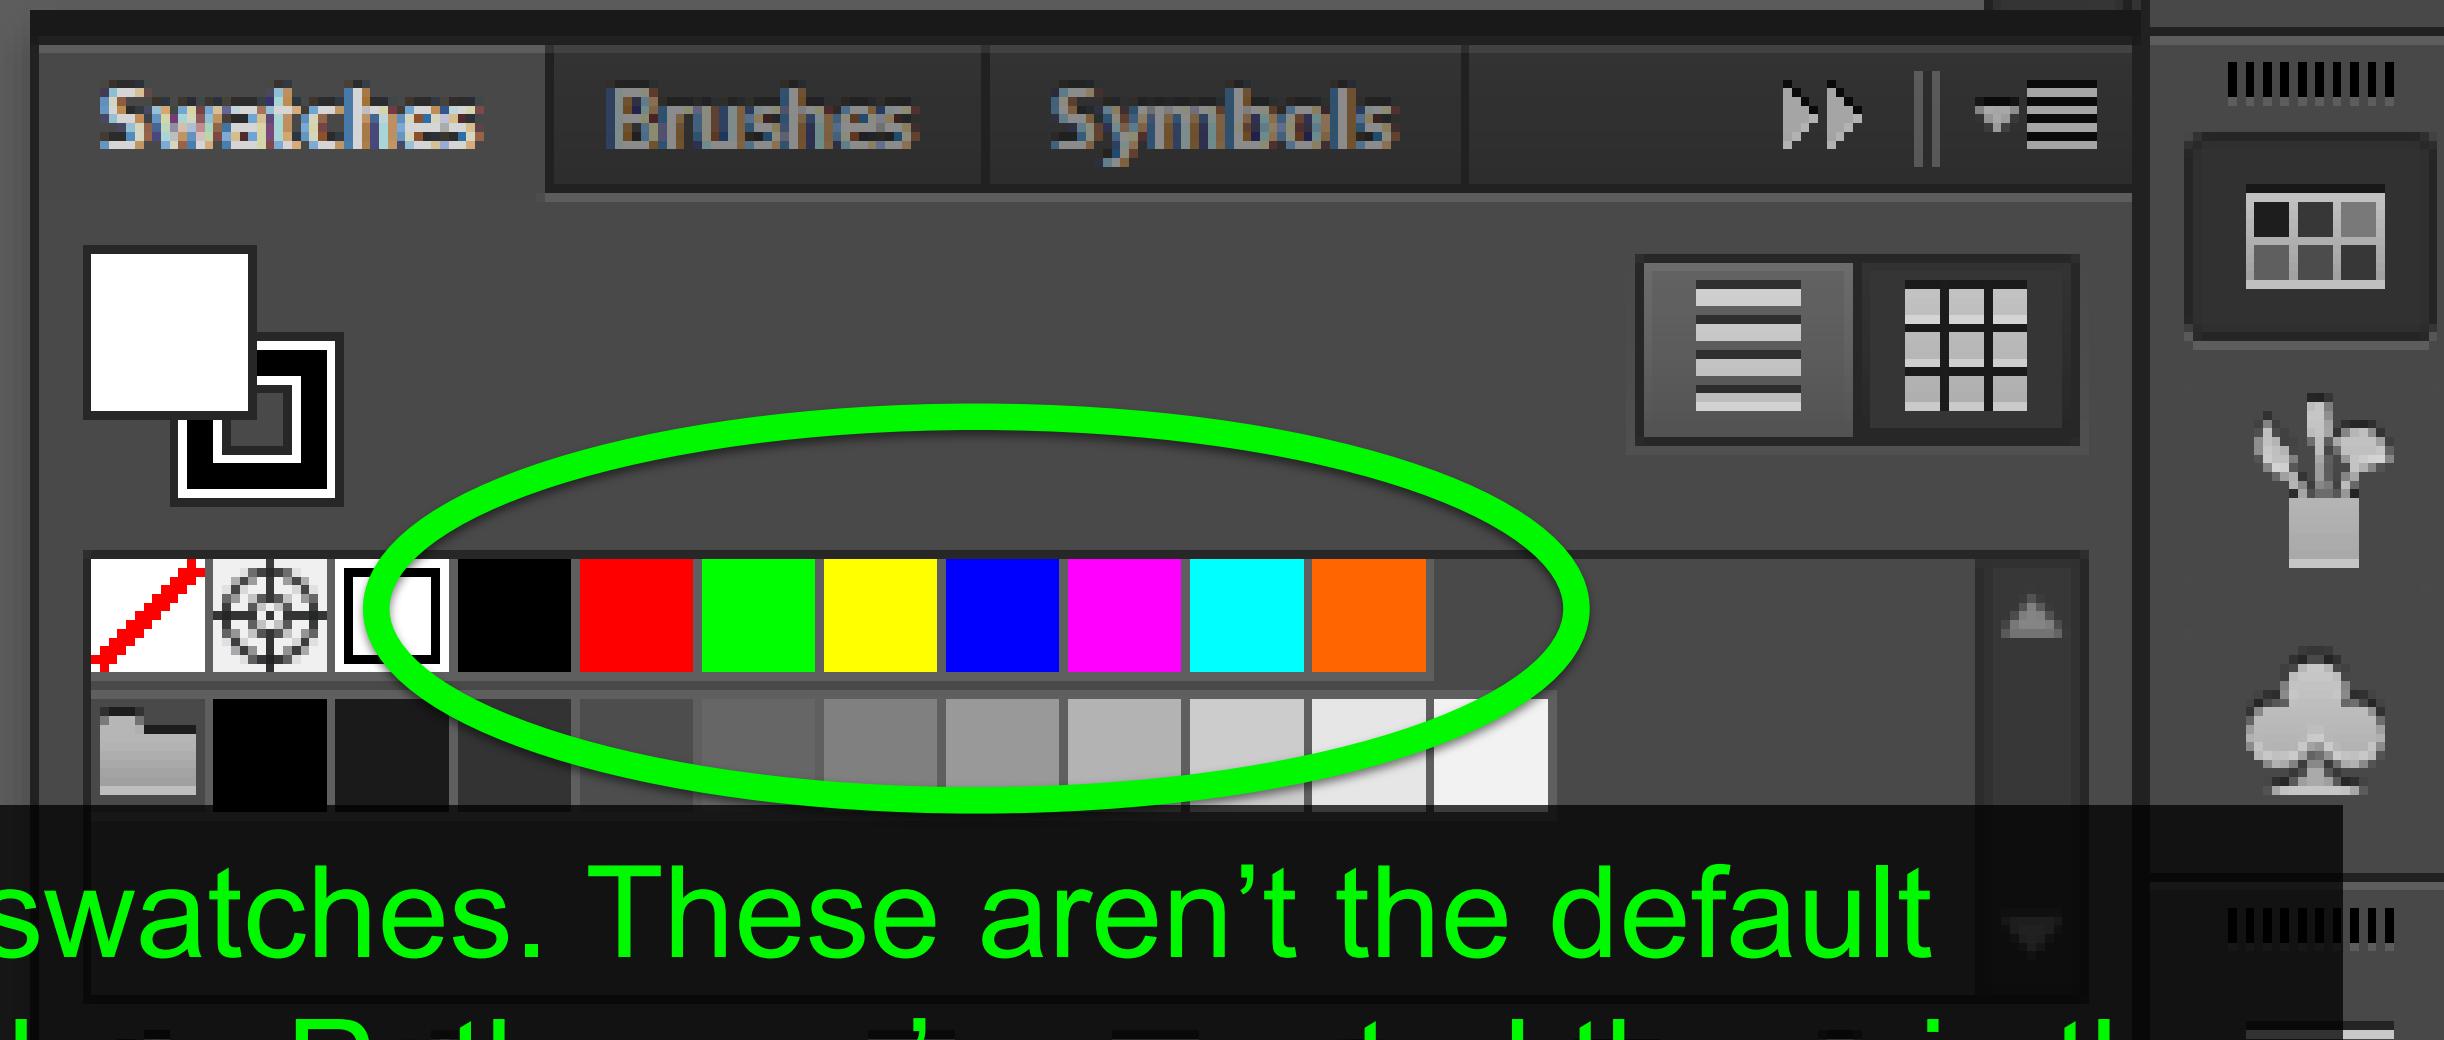

(/Preview) 10 5 15

We want this to be a cut, so we'll set the STROKE to 0.01pt.

We need to change the FILL and STROKE colors as well. (The defaults, WHITE and BLACK won't give us the right results.)

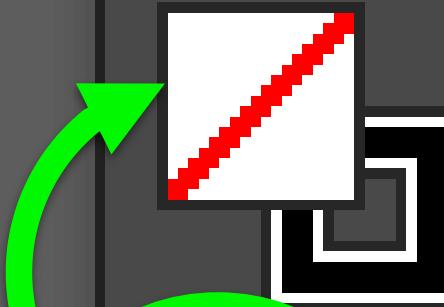

Notice these 8 swatches. These aren't the default illustrator swatches. Rather, we've created these in the template file because they are specific RGB values that the laser software knows. For the purposes of this tutorial, the specific swatches you care about are RED, BLUE, and BLACK.

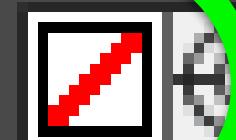

Swatches

Brushes

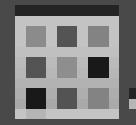

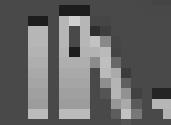

Symbols

For cutting, set the FILL to **NONE**.

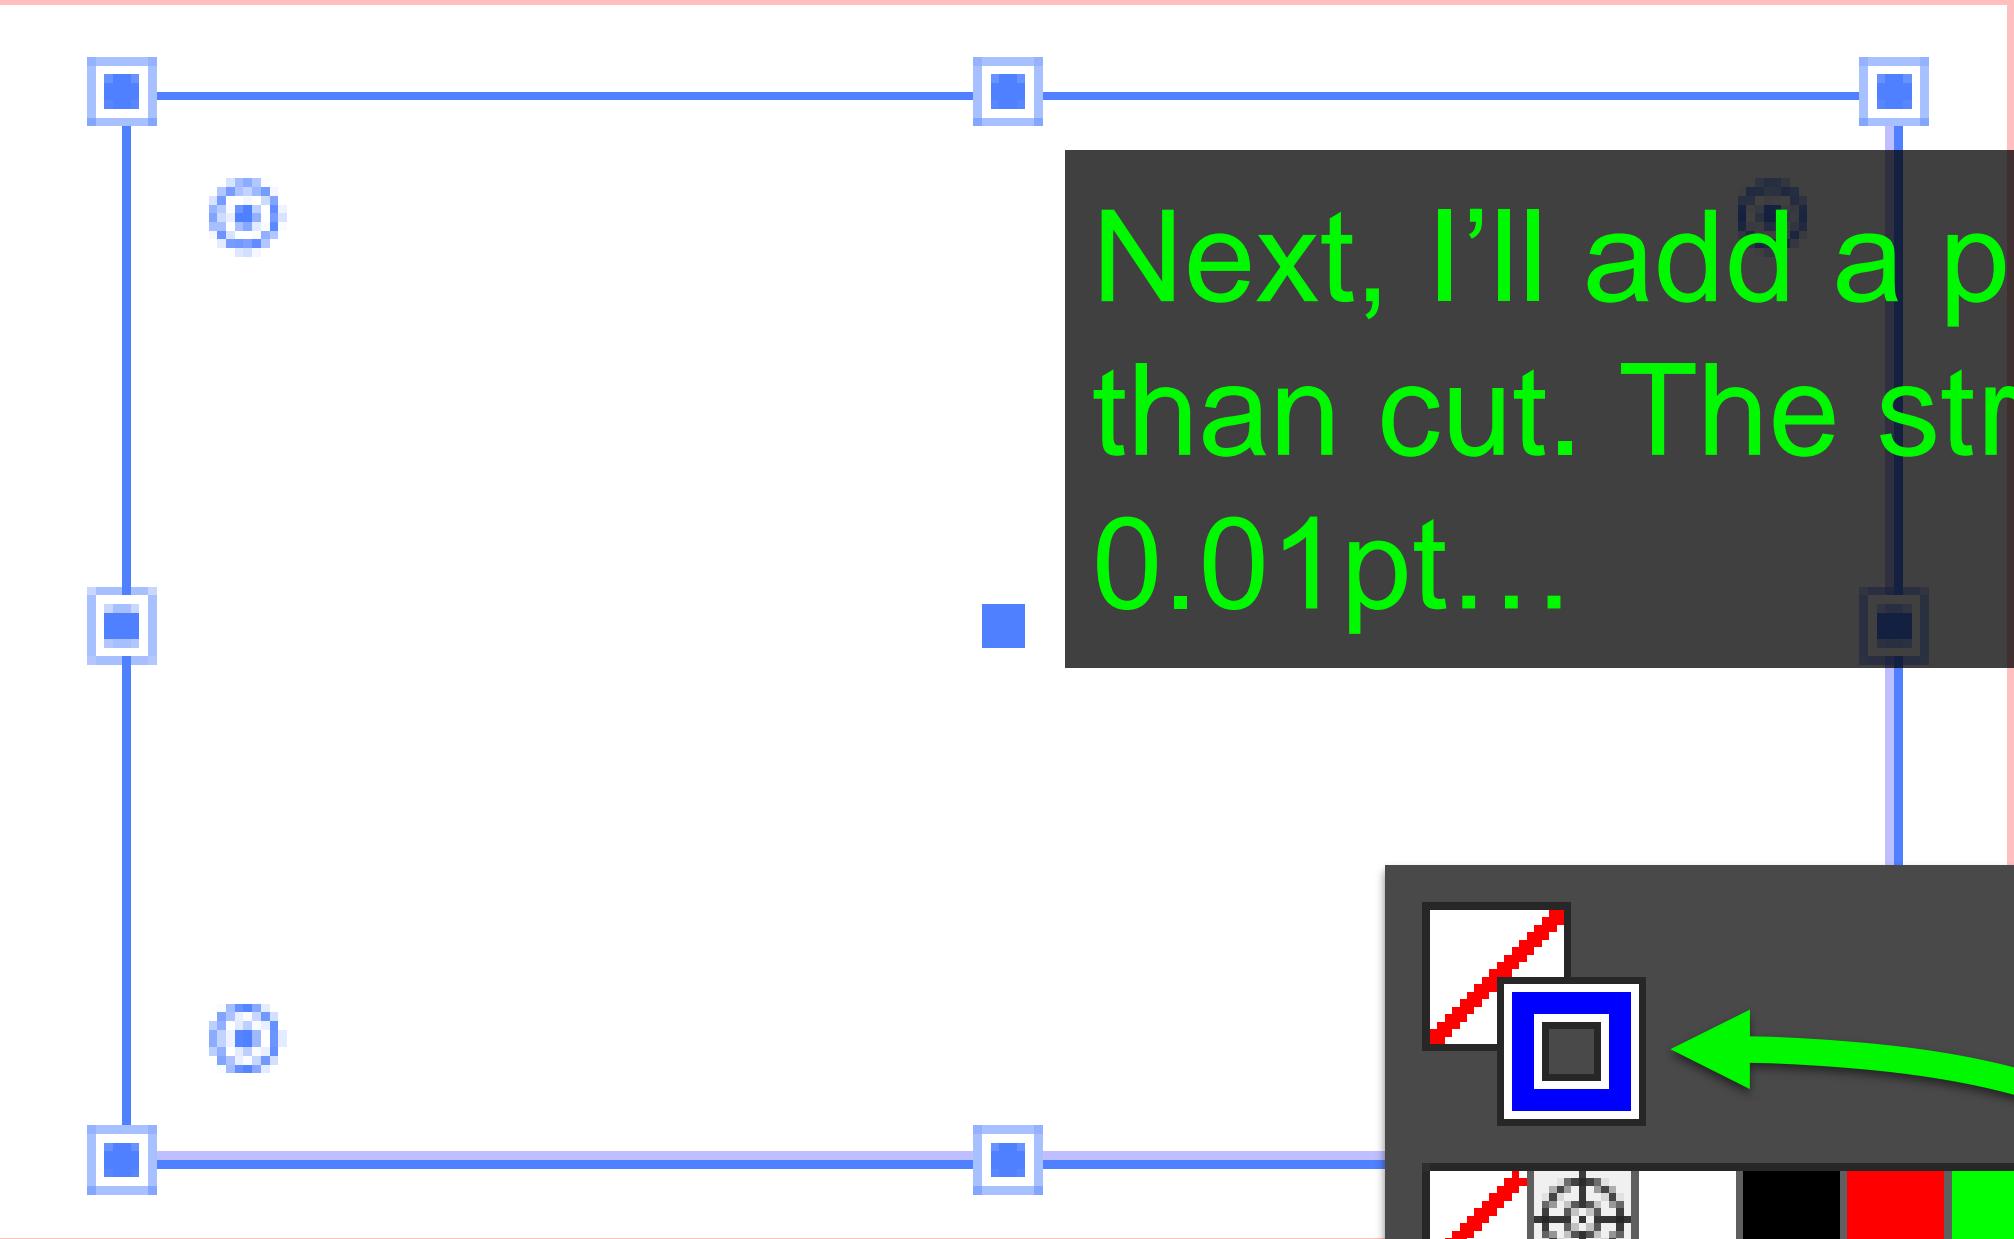

[None]

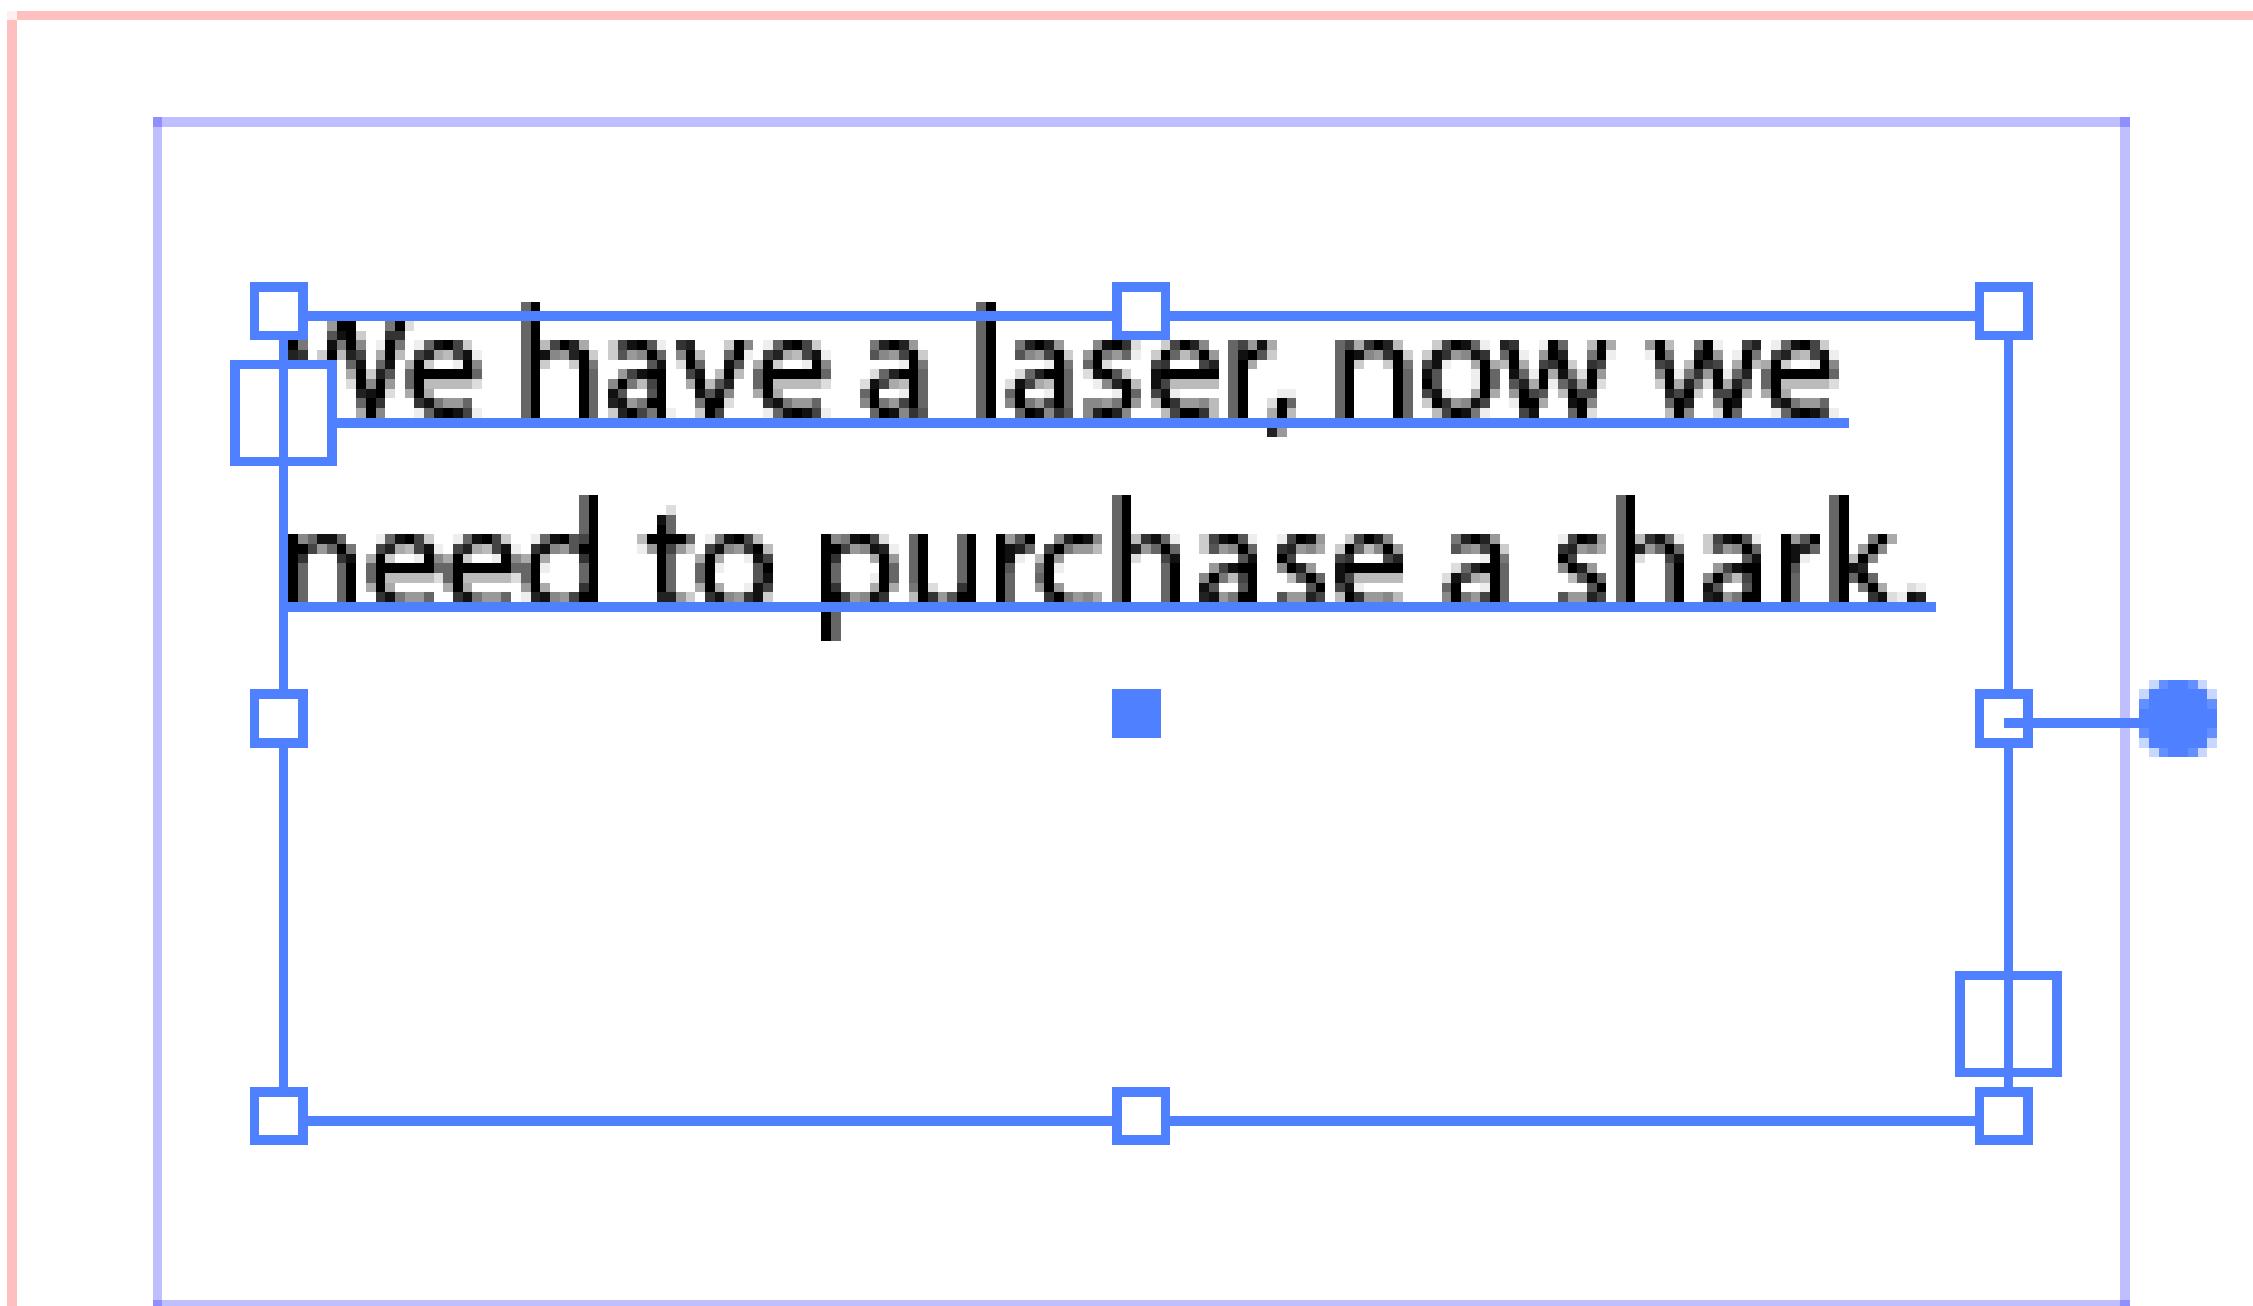

And set the **STROKE** to **RGB RED**.

Next, I'll add a path to engrave, rather than cut. The stroke width is set to 0.01pt...

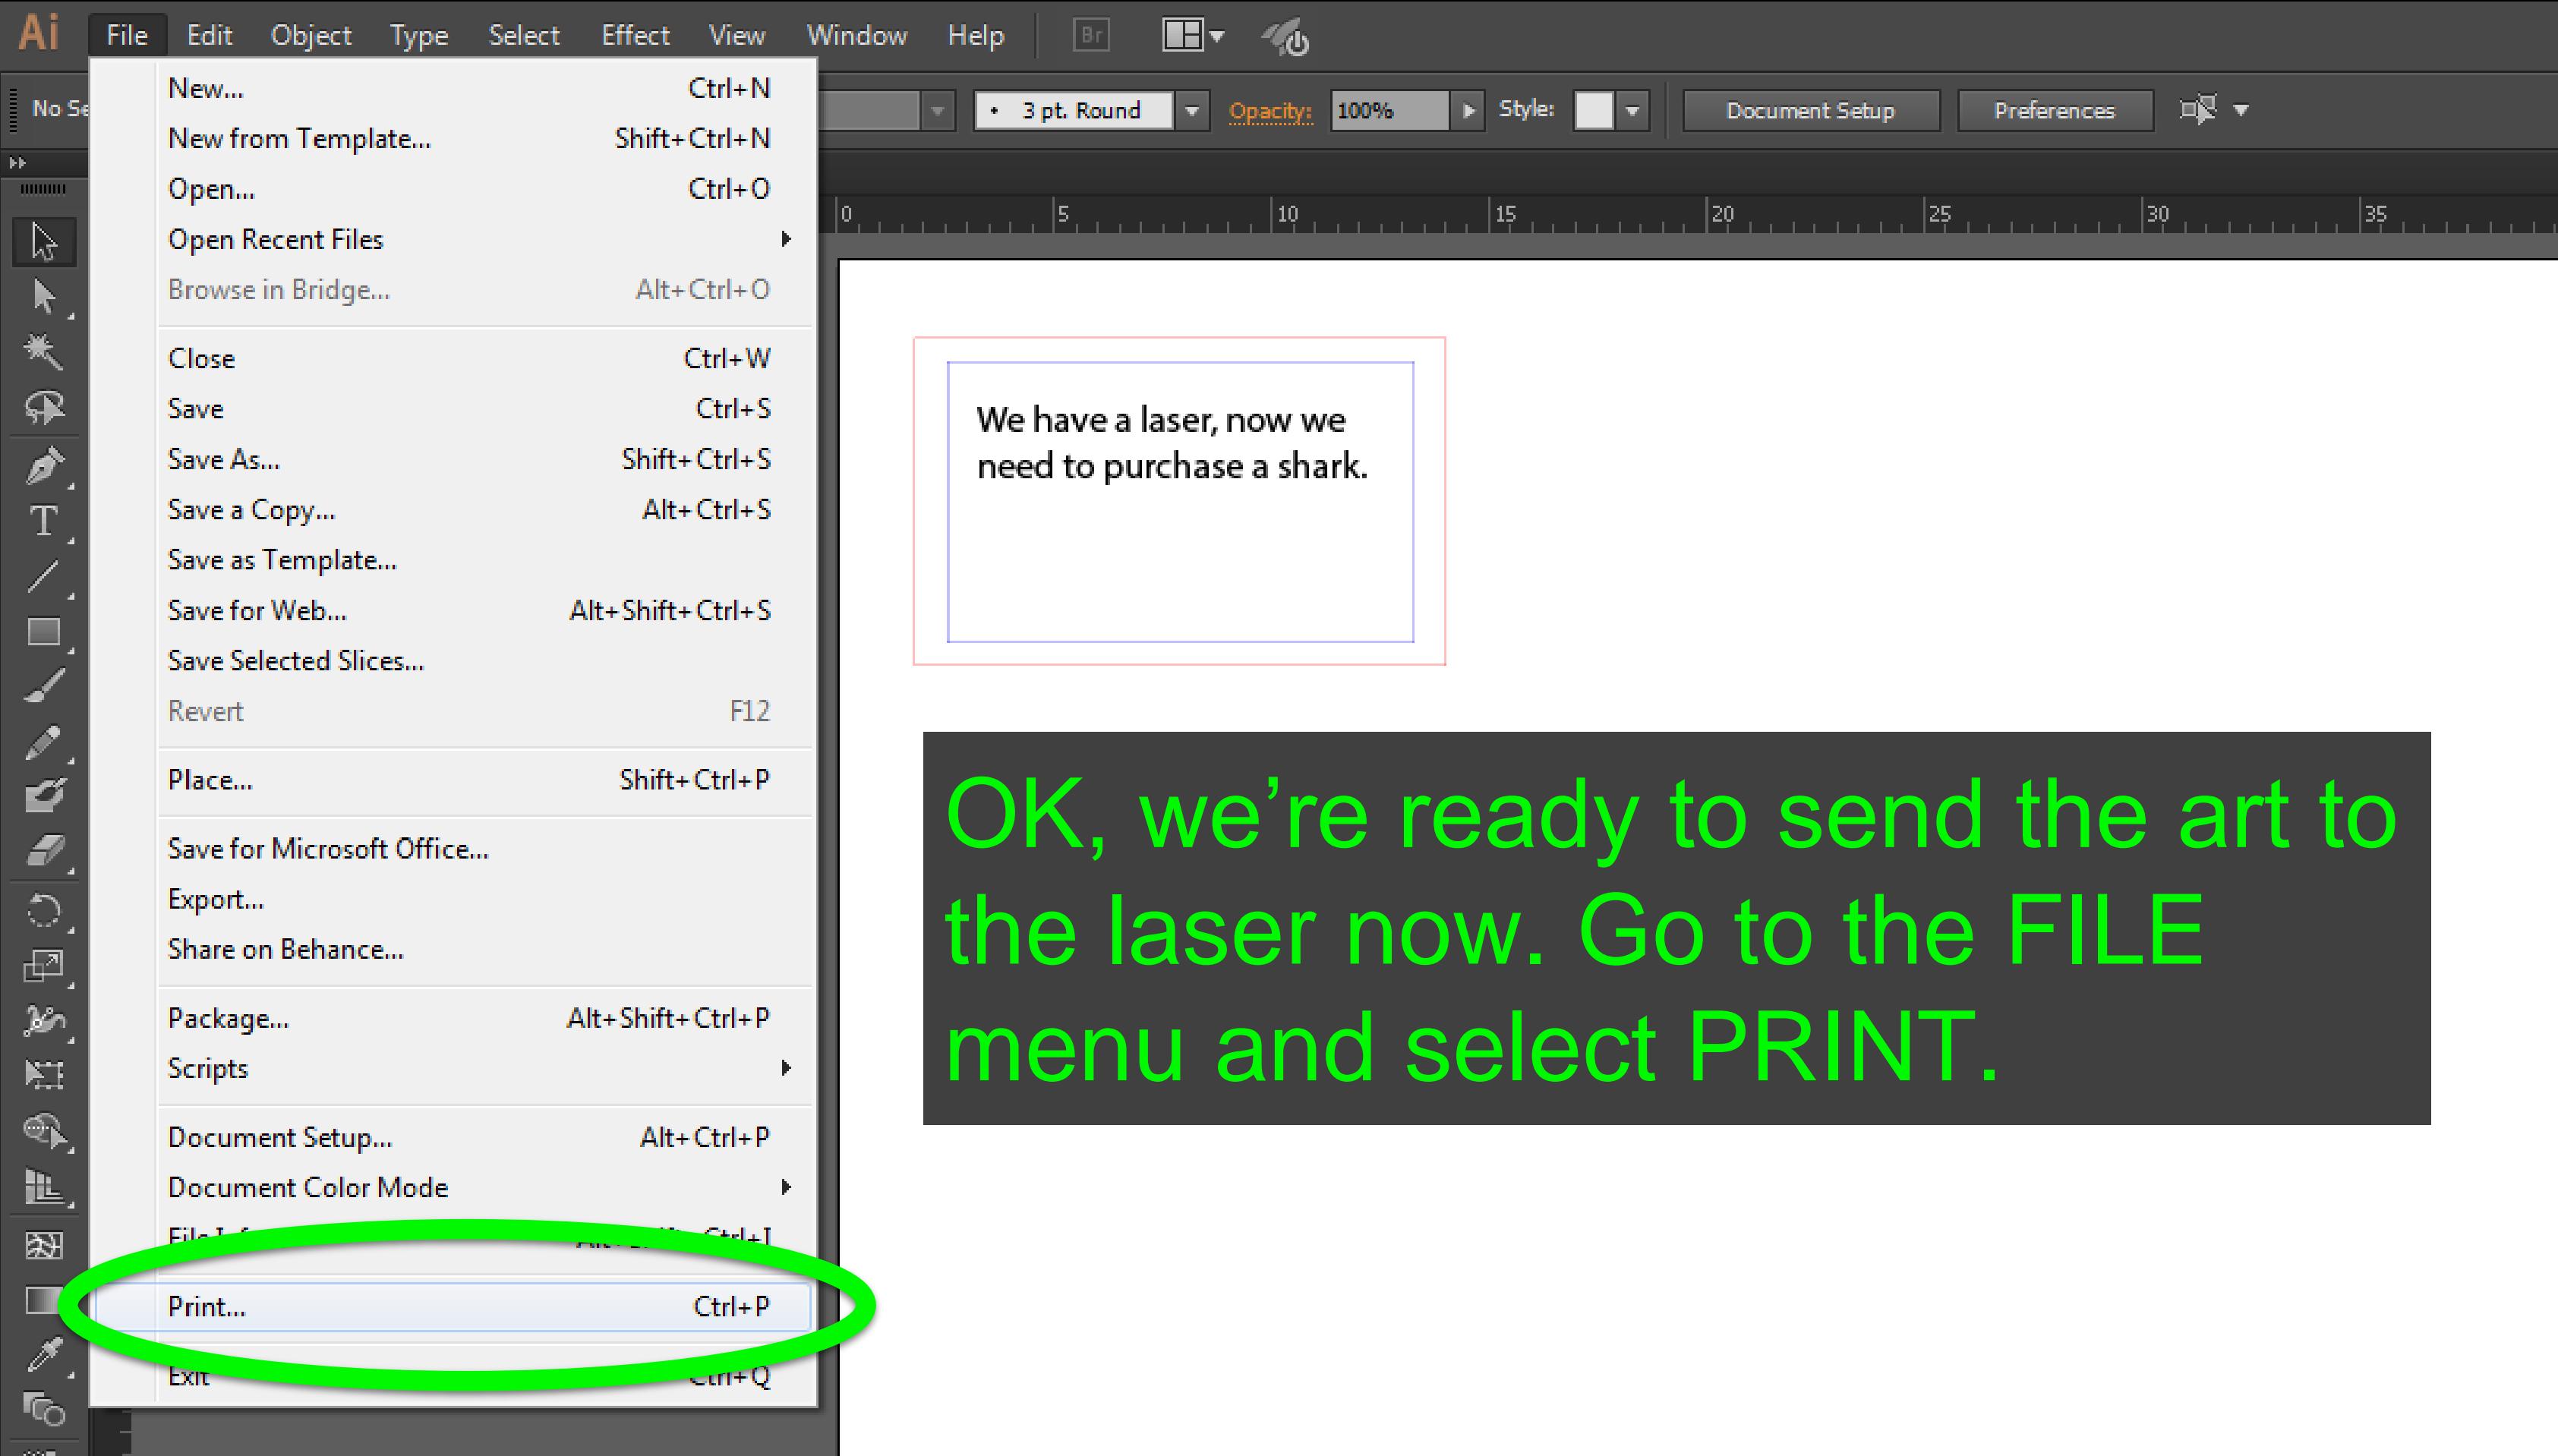

... and set the **STROKE** to **RGB BLUE**
with the fill to None.

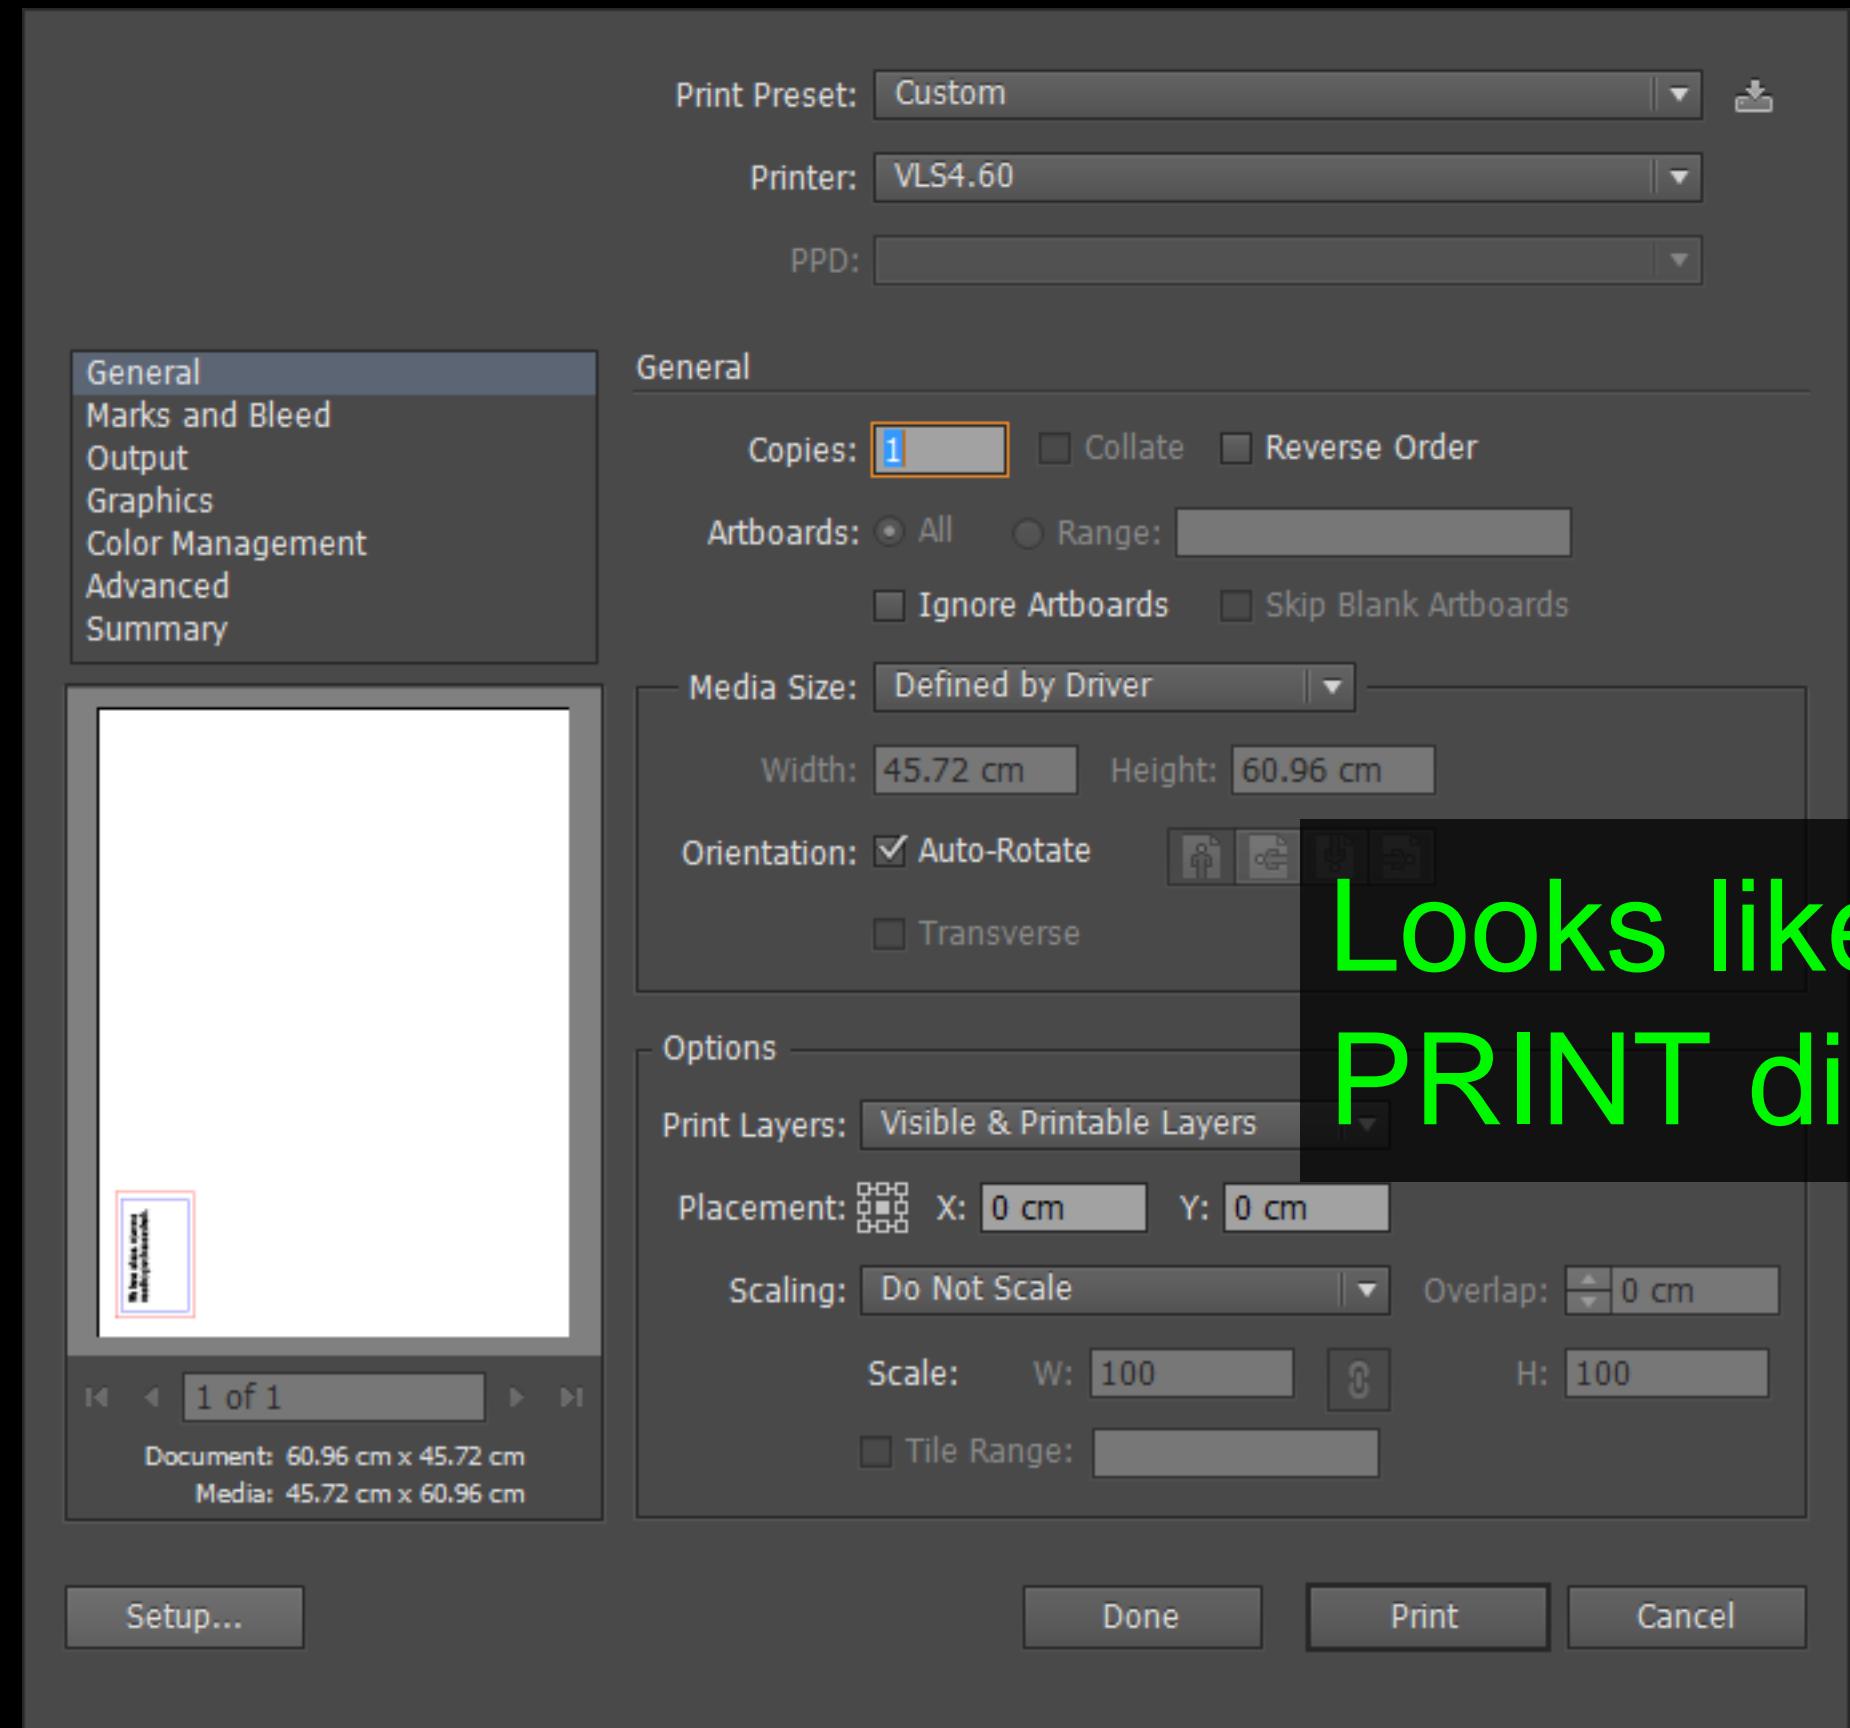

We have a laser, now we
need to purchase a shark.

Finally, I'll add some text. It has a BLACK fill and no stroke.

Remember, anything with a FILL,
no matter what color, will
automatically turn into a raster
engraving. Same goes for anything
with a stroke greater than 0.01pt.

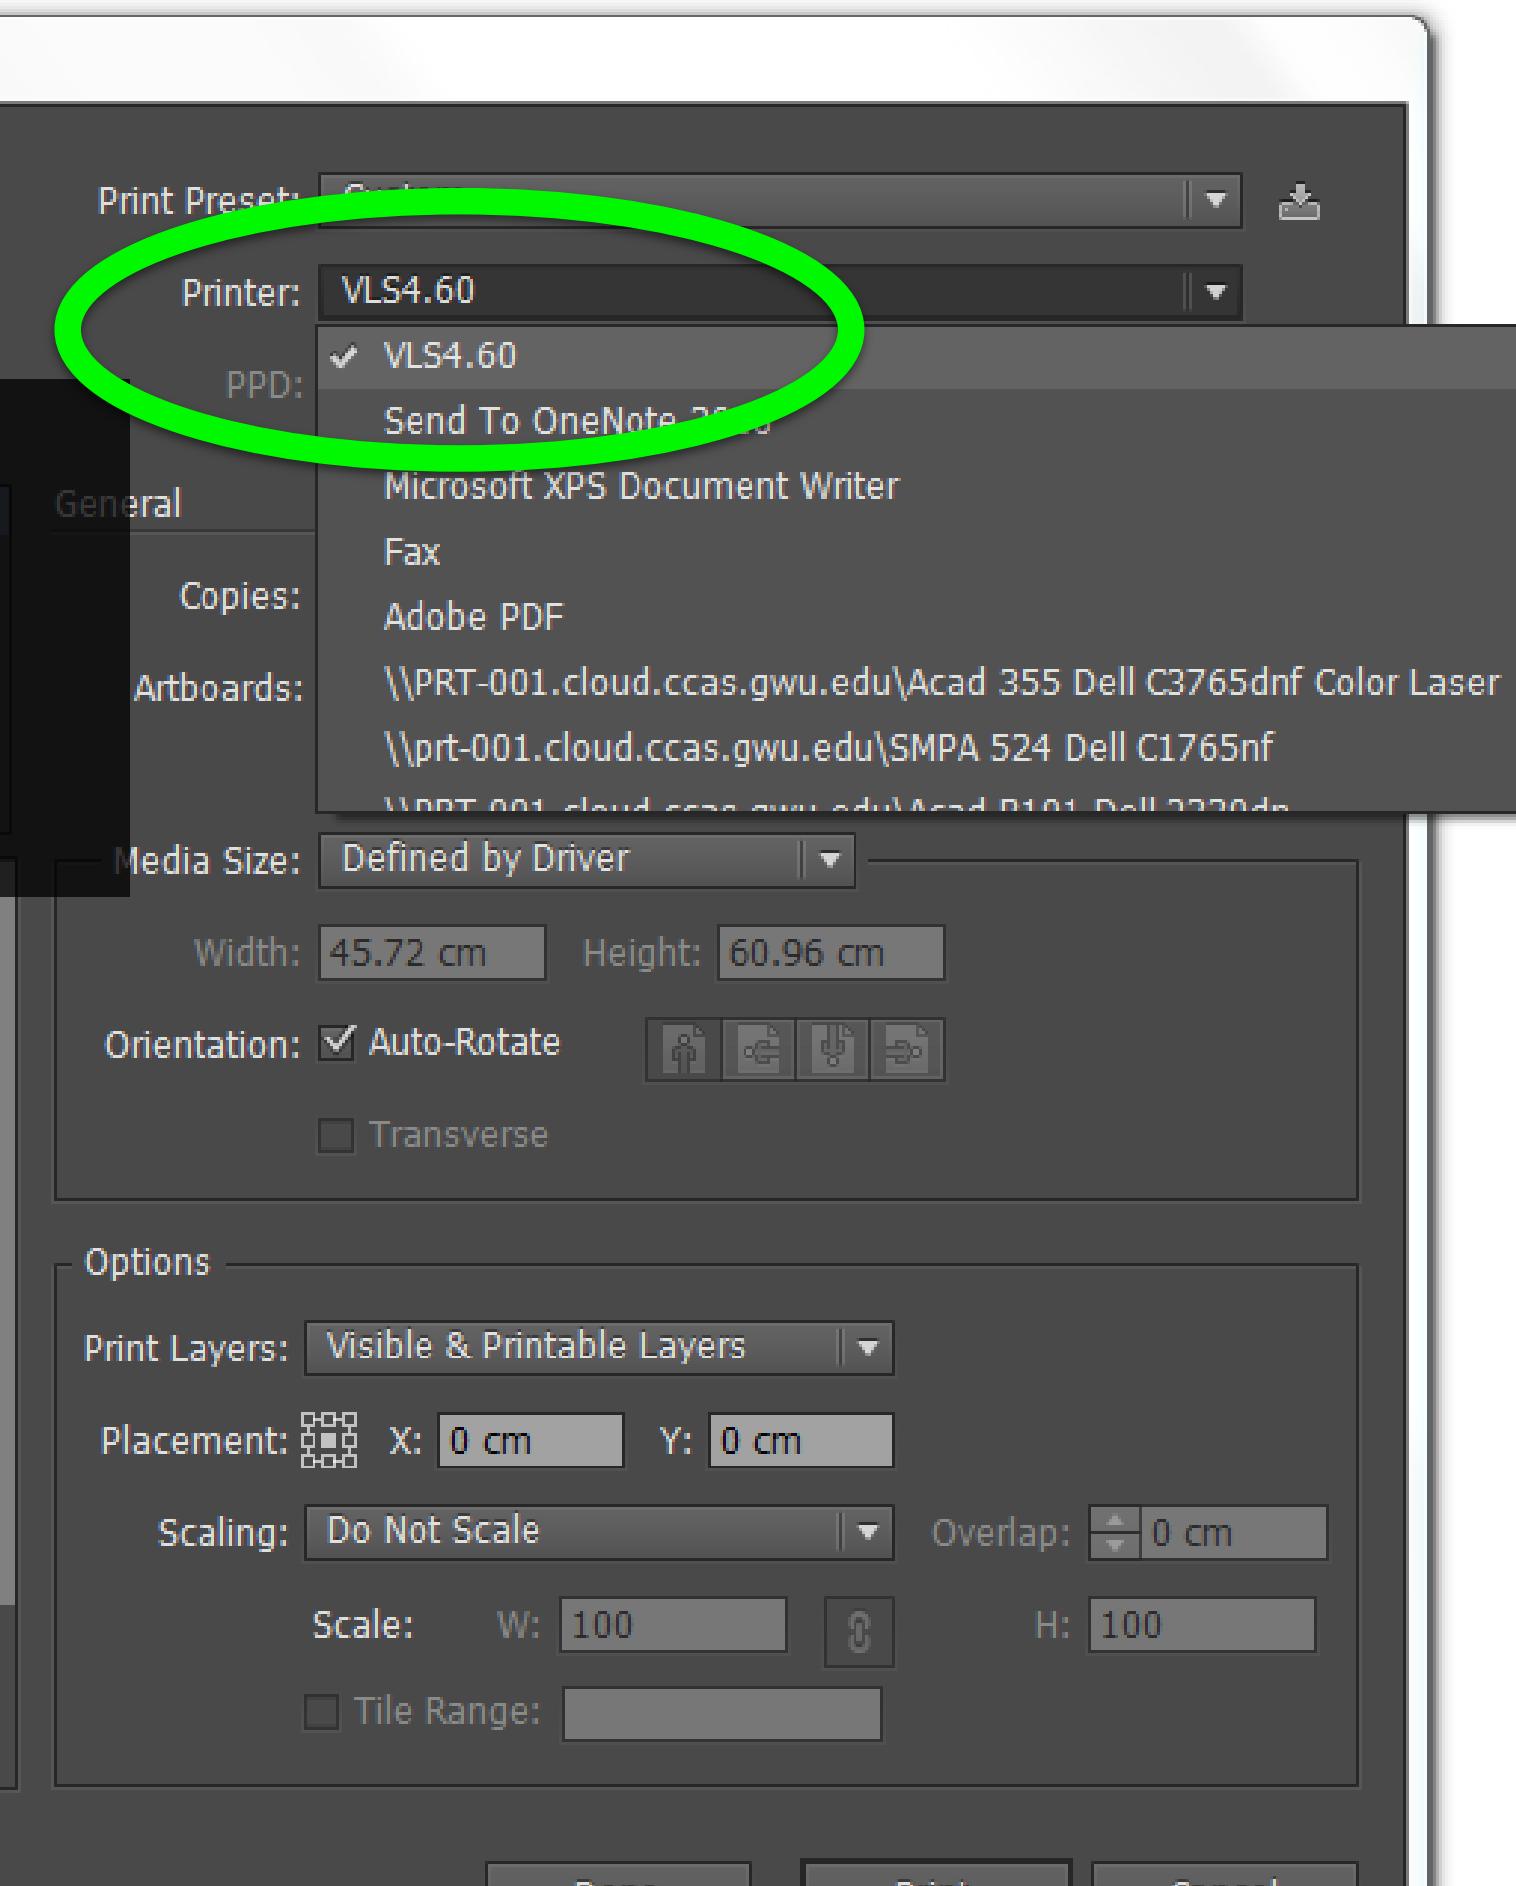

Looks like a normal
PRINT dialog.

Print

Make sure 'Printer' is set to one of the lasers.

Use RGB red swatch
Set STROKE to 0.0
Set FILL to NONE

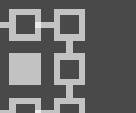

Use RGB blue swatch
Set STROKE to 0.0

What about other materials that aren't in the database? Custom settings can be created for other materials, but that's beyond the scope of this tutorial.

A close-up photograph showing a person's fingers holding a long, thin strip of white material, likely mat board, at an angle. The strip is positioned diagonally across the frame, from the bottom left towards the top right. The background is a light-colored wooden surface. In the bottom right corner, there is a black rectangular box containing green text.

I'm going to demo using
mat board.

Cancel

We have a laser, now we
need to purchase a shark.

OK...
ummm...
nothing happened.

DON'T PANIC!

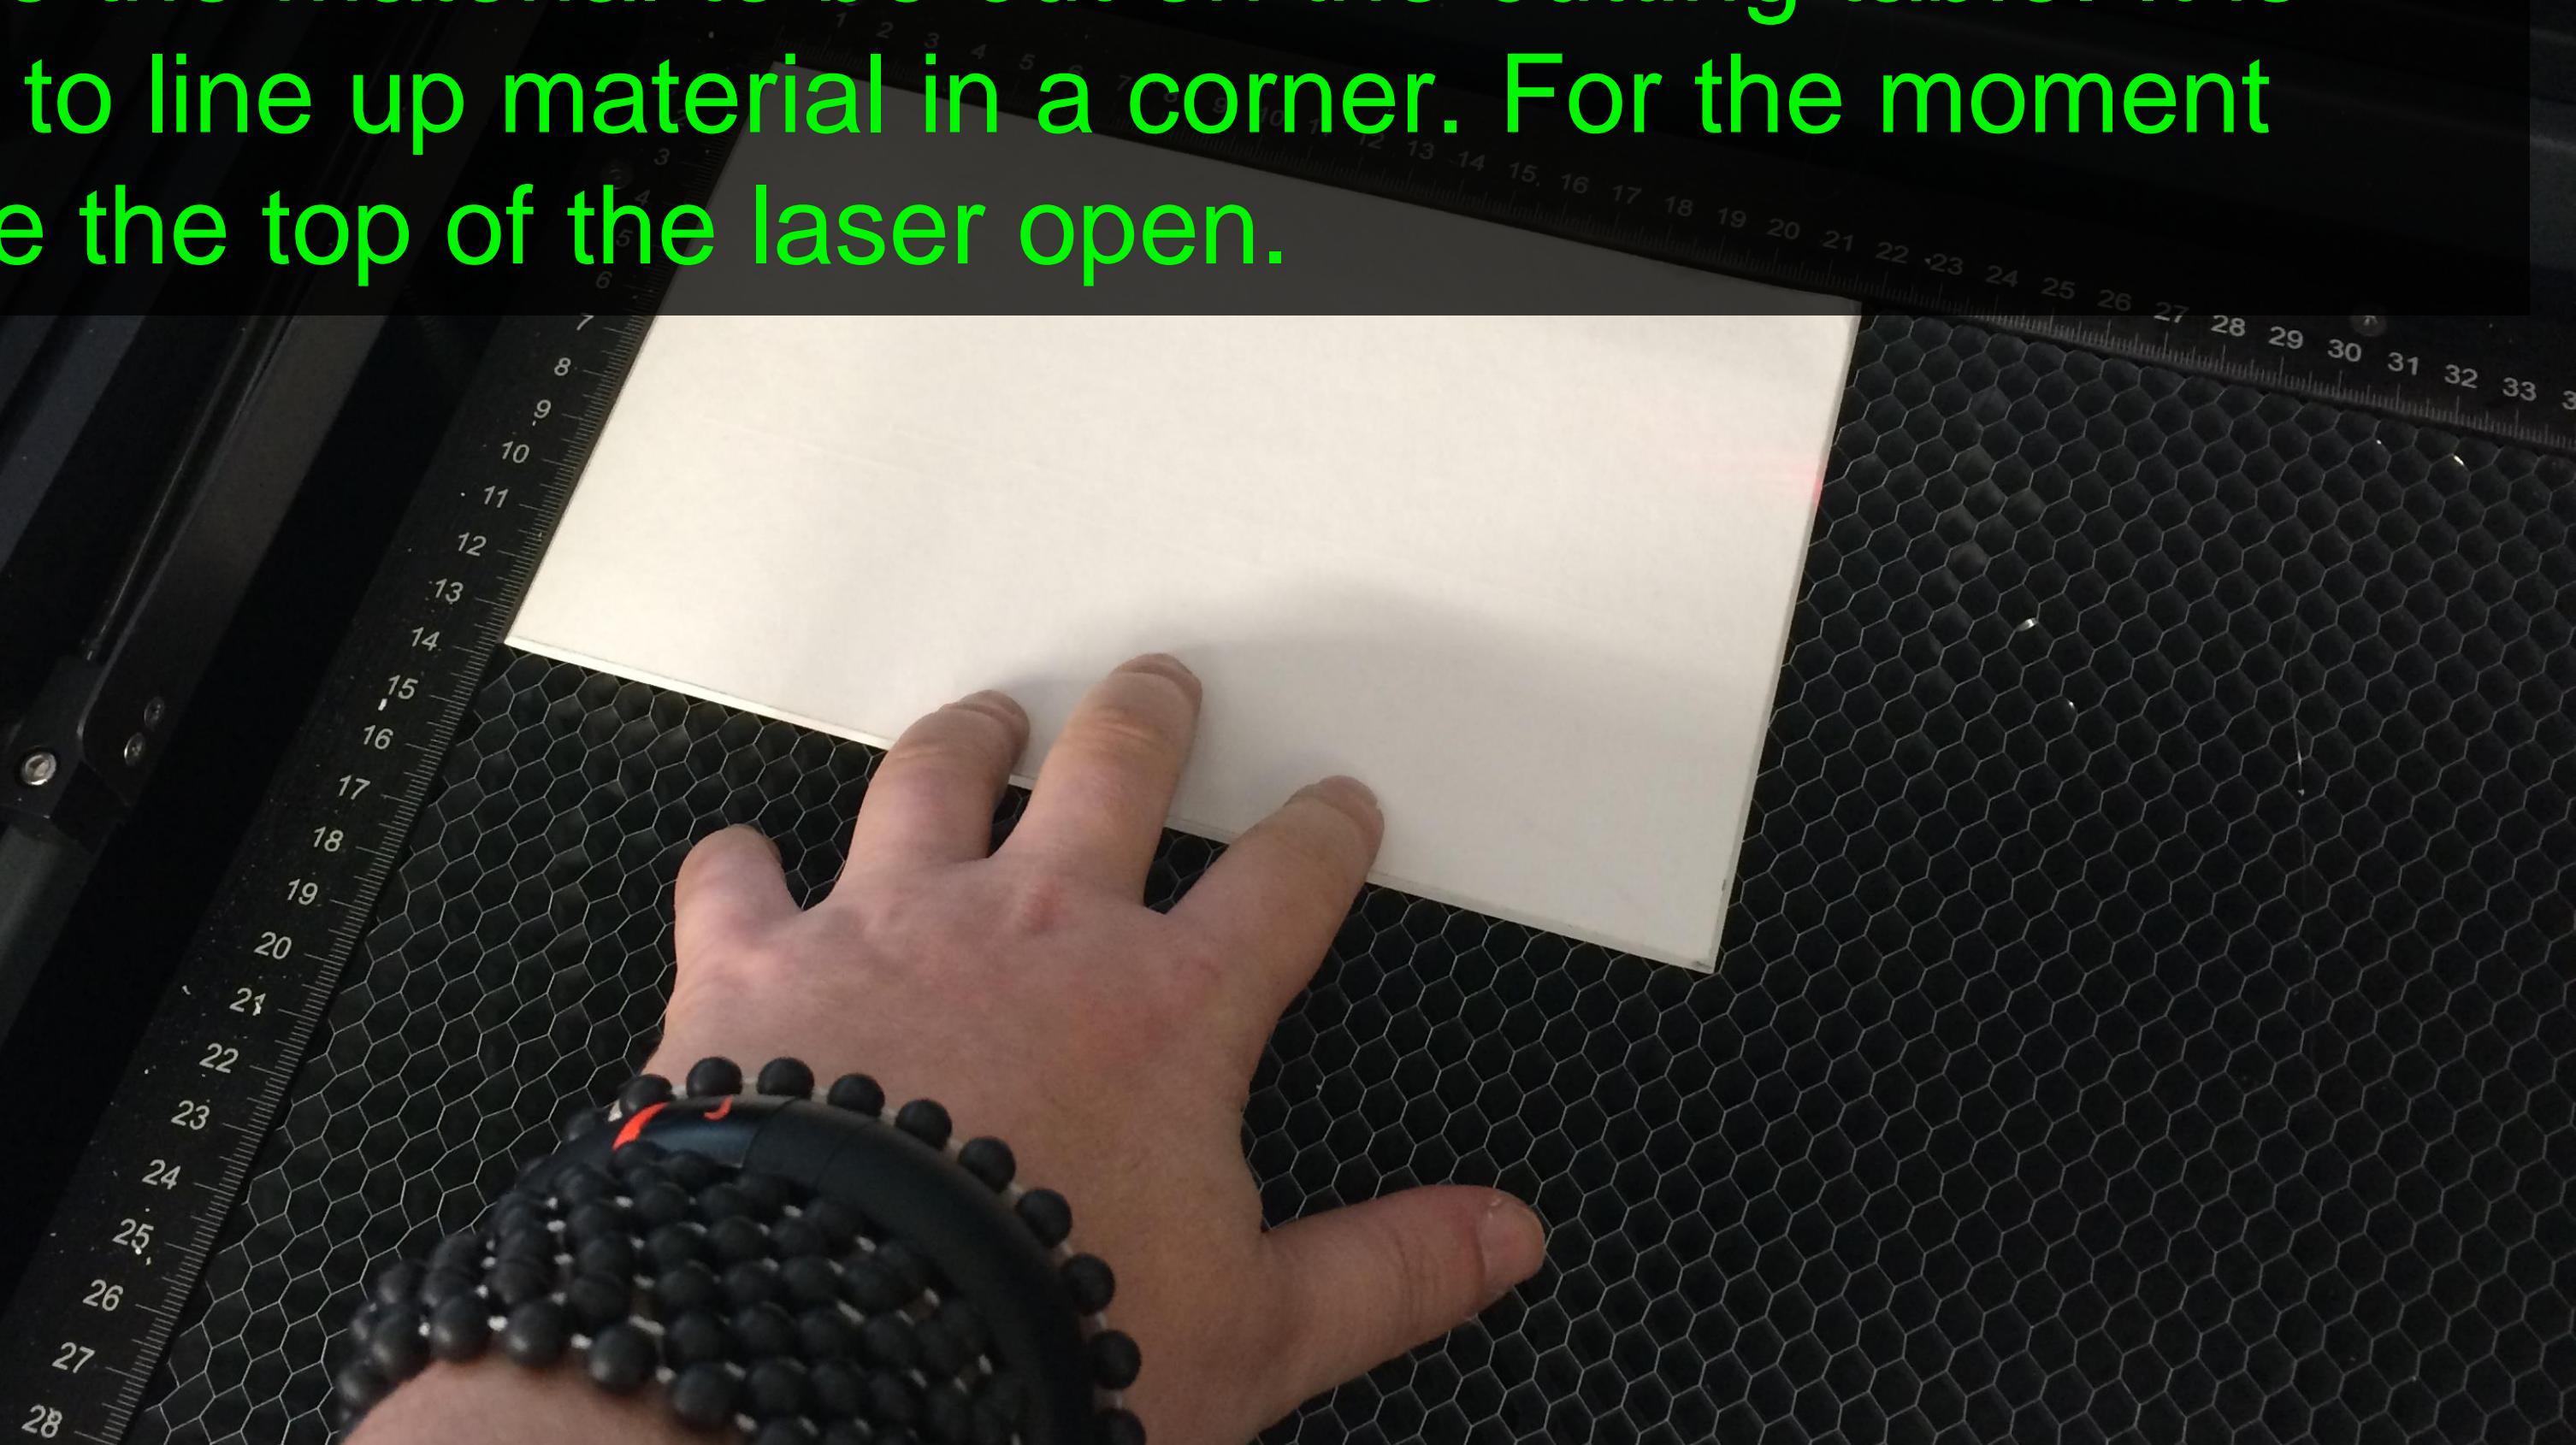

Because we need to go
the laser's control panel.
It's found in the dock at
the bottom of the screen.

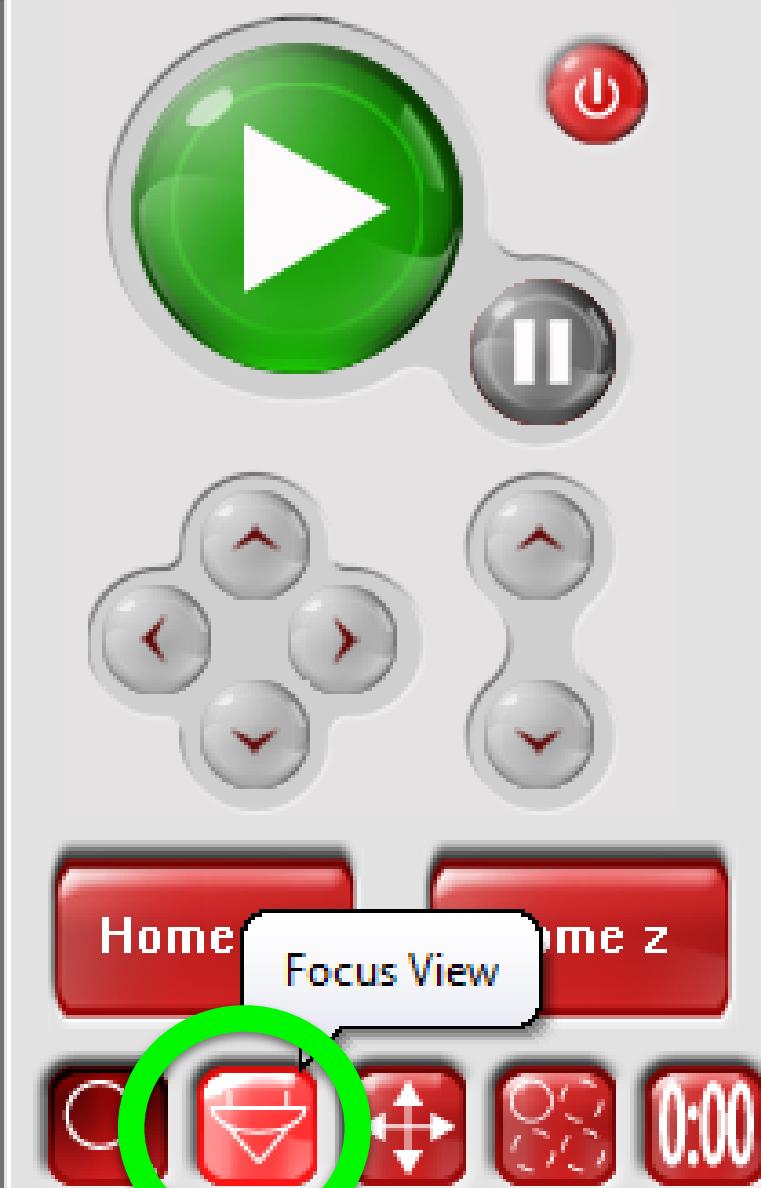

Gently lift the top of the laser.

Place the material to be cut on the cutting table. It is best to line up material in a corner. For the moment leave the top of the laser open.

15 16 17 18 19 20 21 22 23

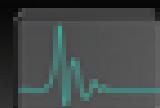

Back in the control panel, click on the FOCUS VIEW button.

X: 24.000"
Y: 0.000"
Z: 0.043"
R: 9.600"

VLS4.60 Control Panel 5.38.5

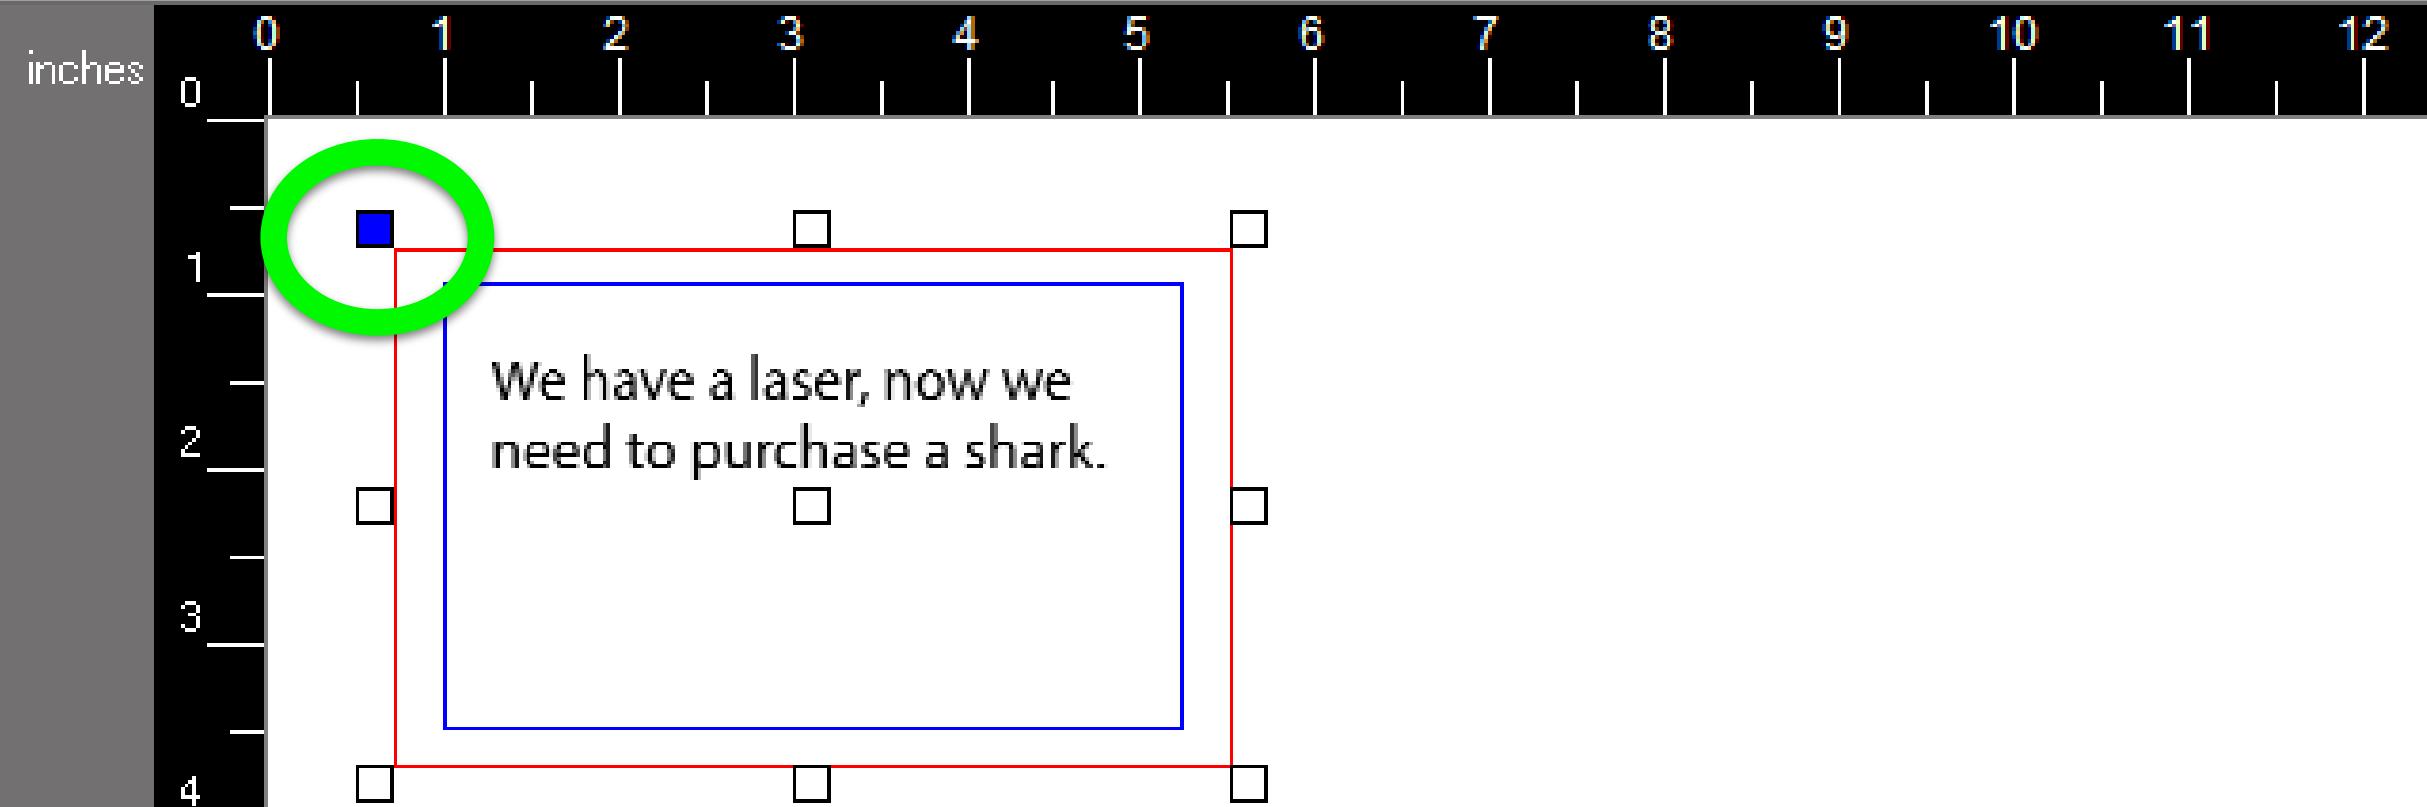

File: 1. Untitled-1

1 of 1

Created on:

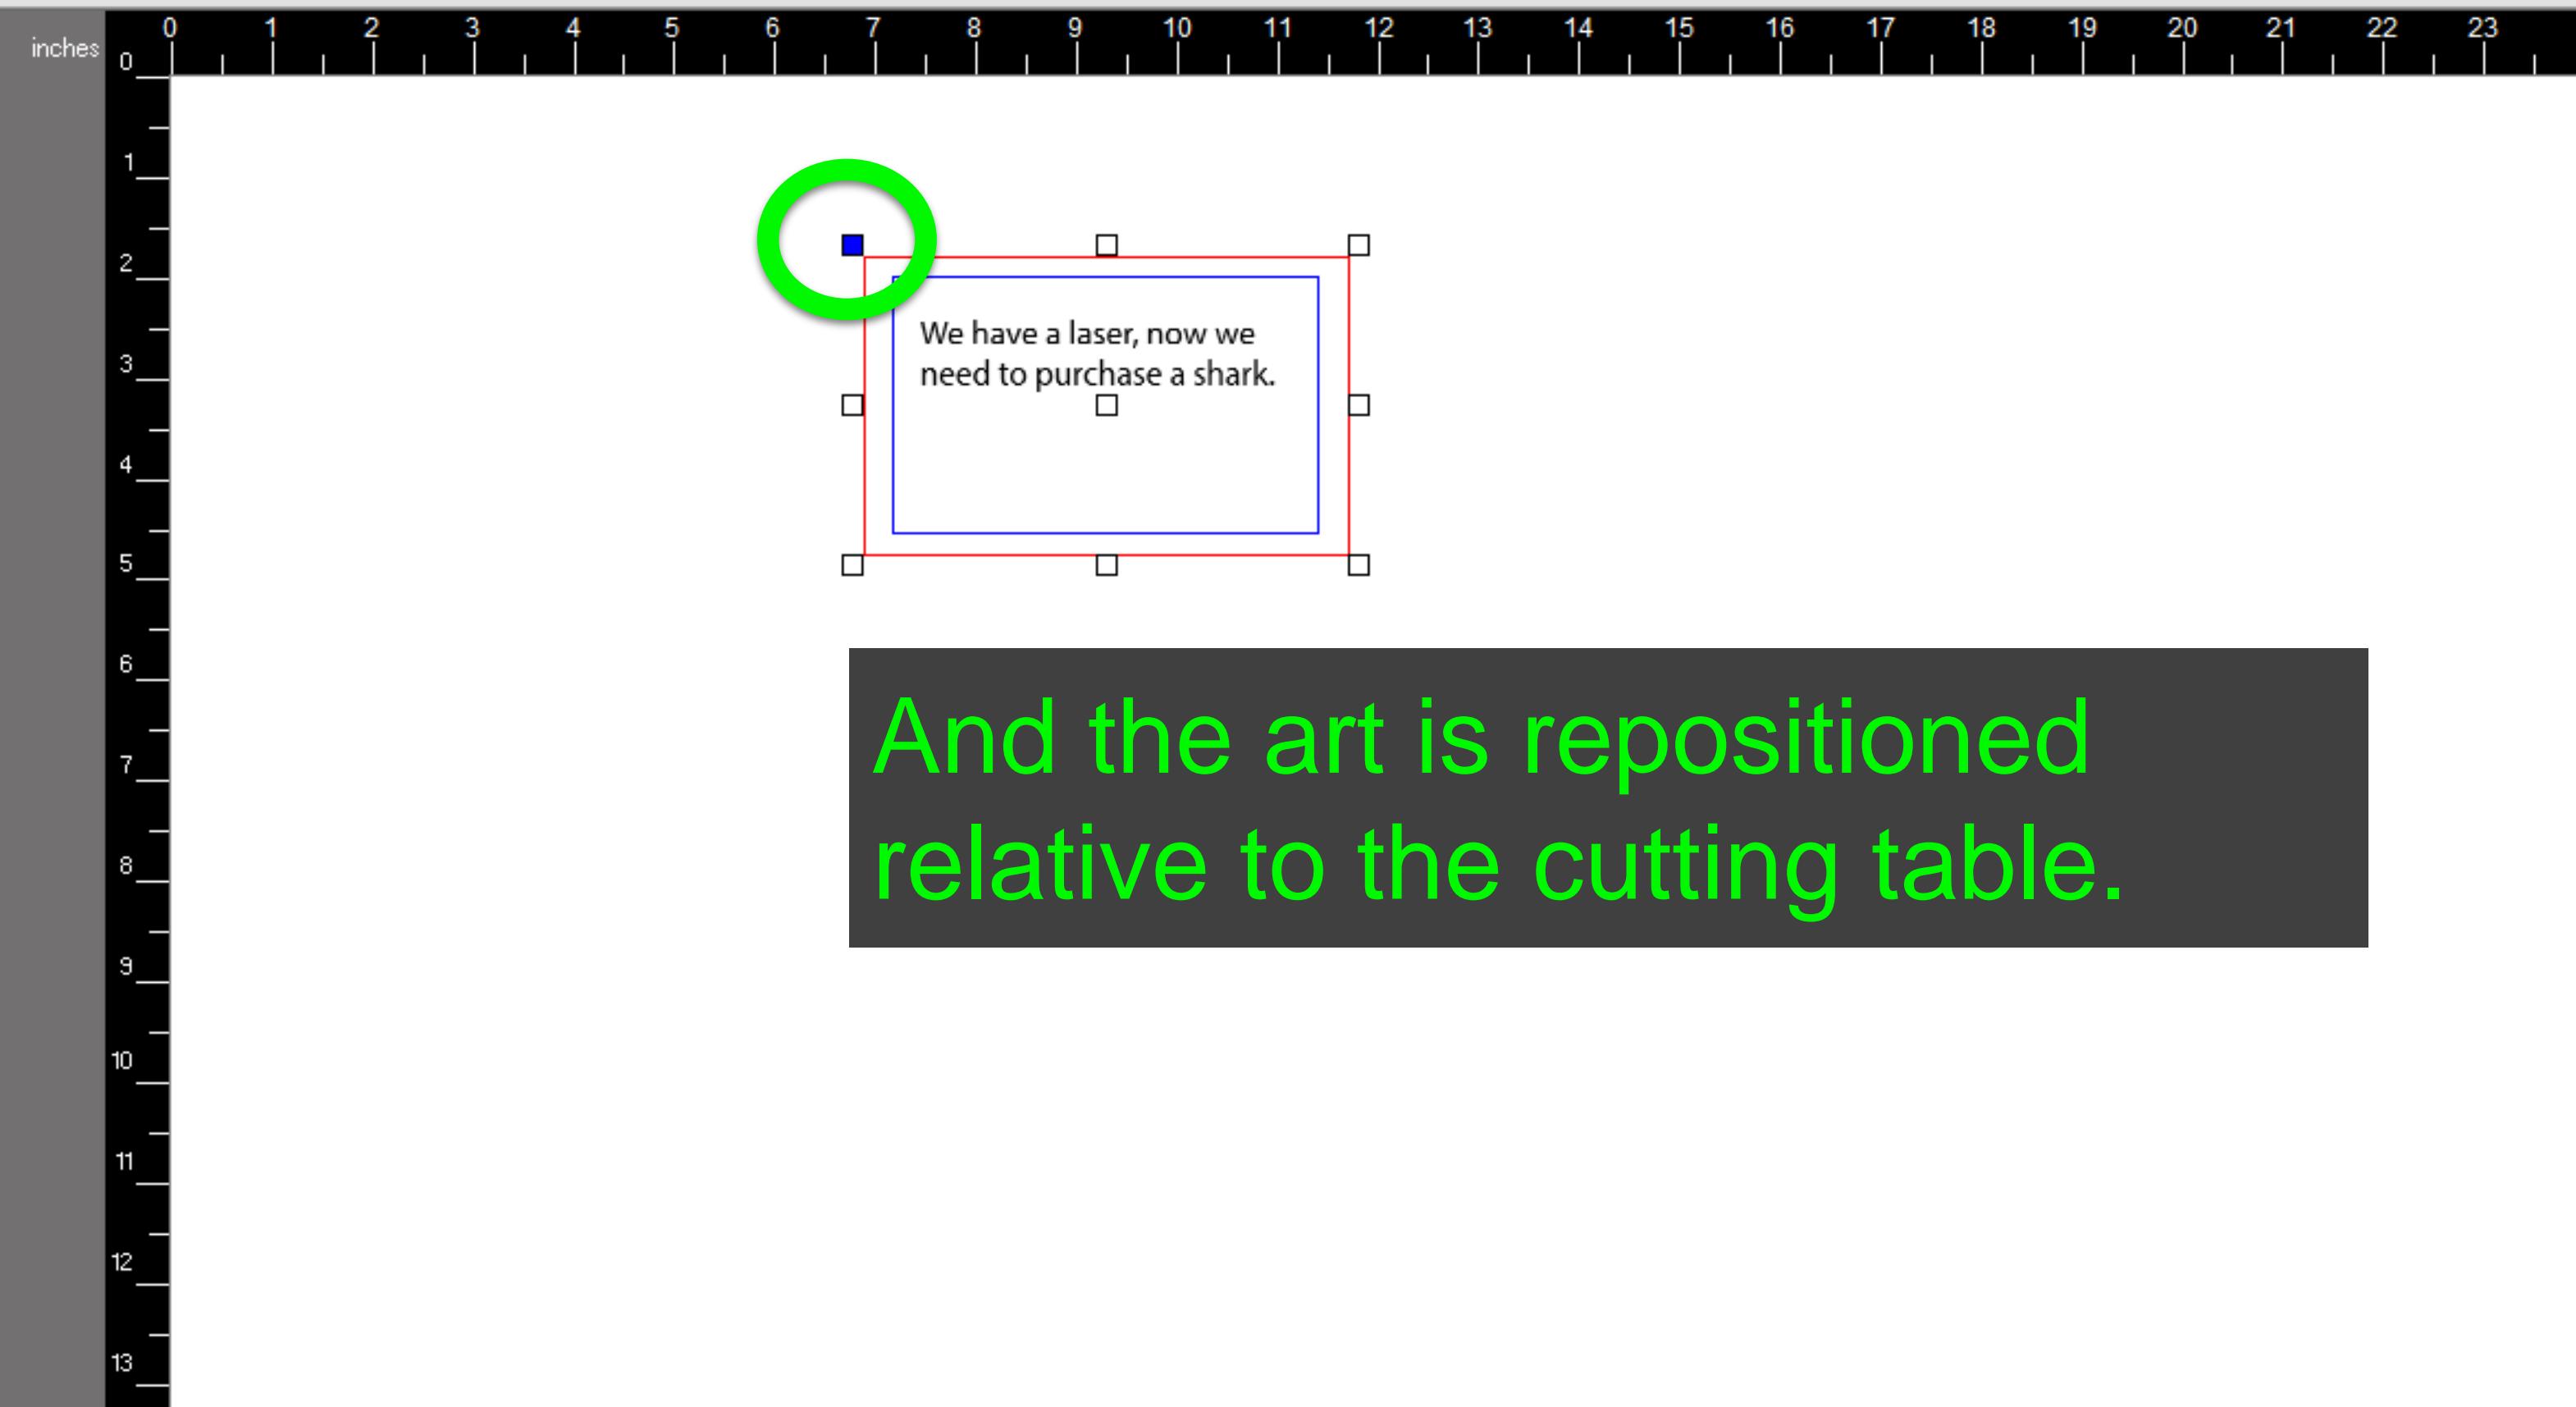

Sun 6 Sep 2015, 2:01pm

Click on a corner tab of the art to align to the current location of the lens (default is upper-left, usually fine.)

Then click on TO POINTER.

And the art is repositioned
relative to the cutting table.

Copies: 0

Runtime: 0:00:00

15 16 17 18 19 20 21 22 23

How long will it take to run the job? Click on that last button to switch to this view...

Copies: 0

Runtime: 0:00:00

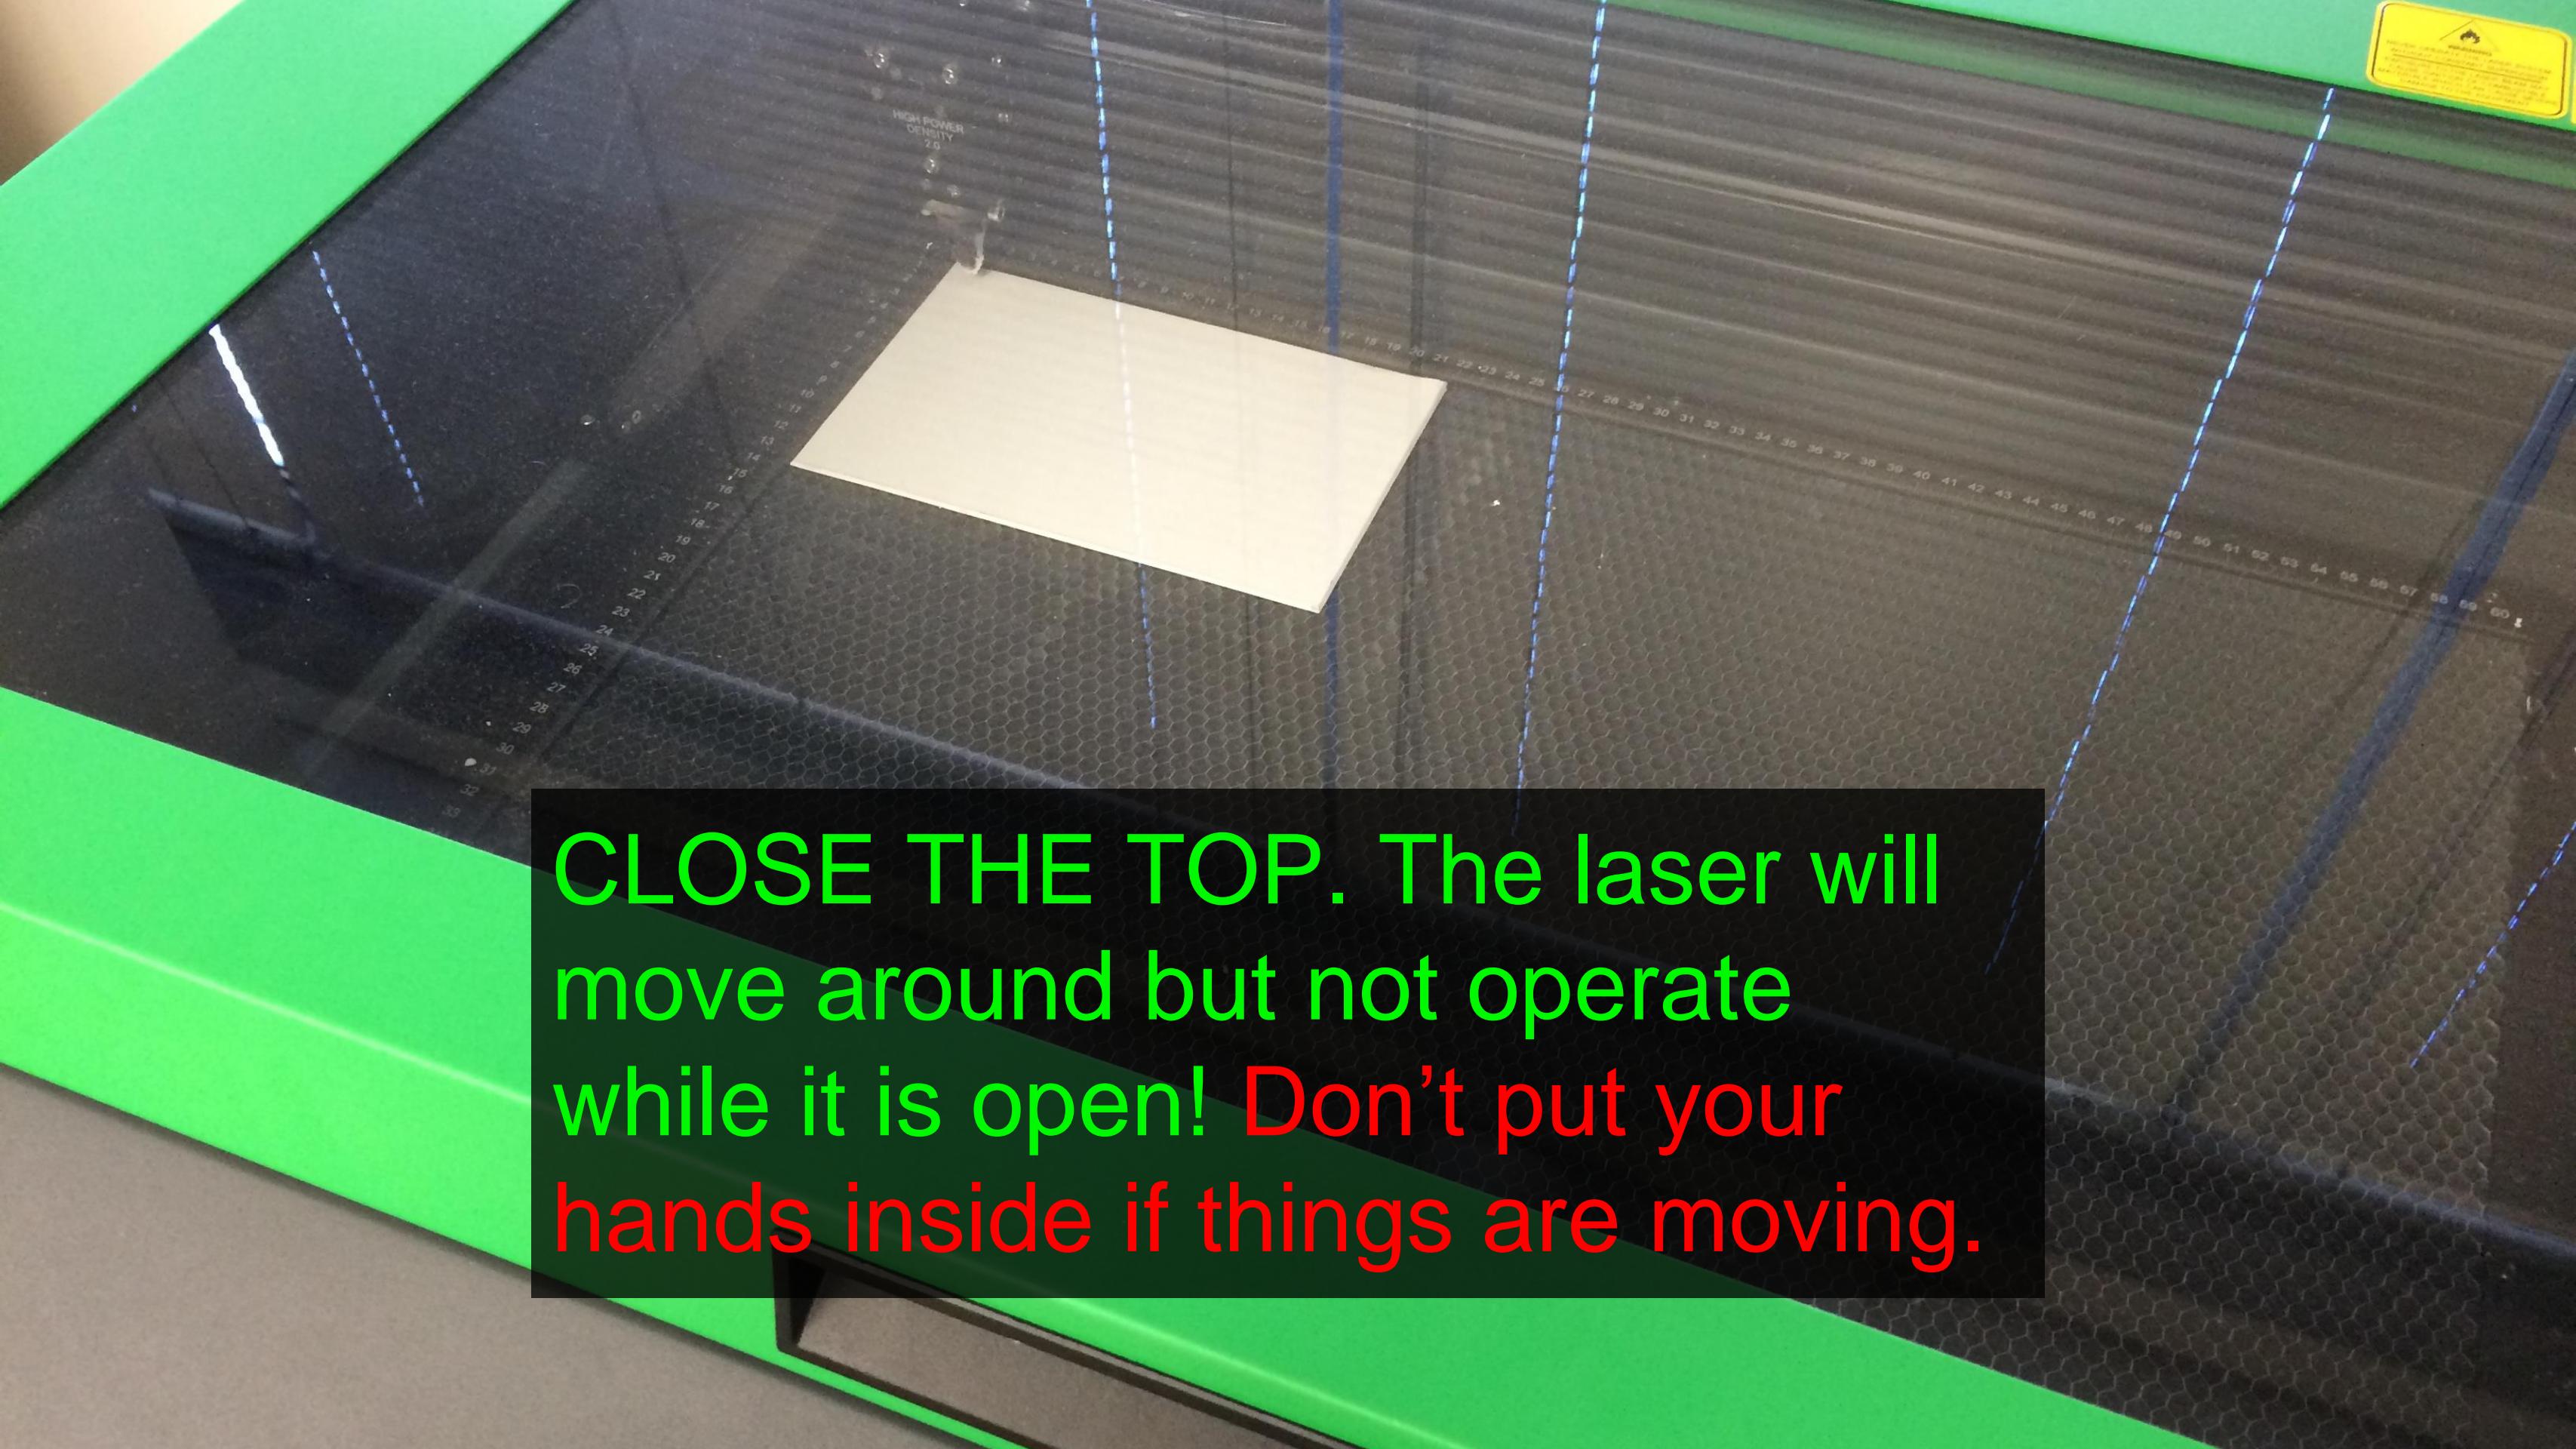

15 16 17 18 19 20 21 22 23

Then click START.

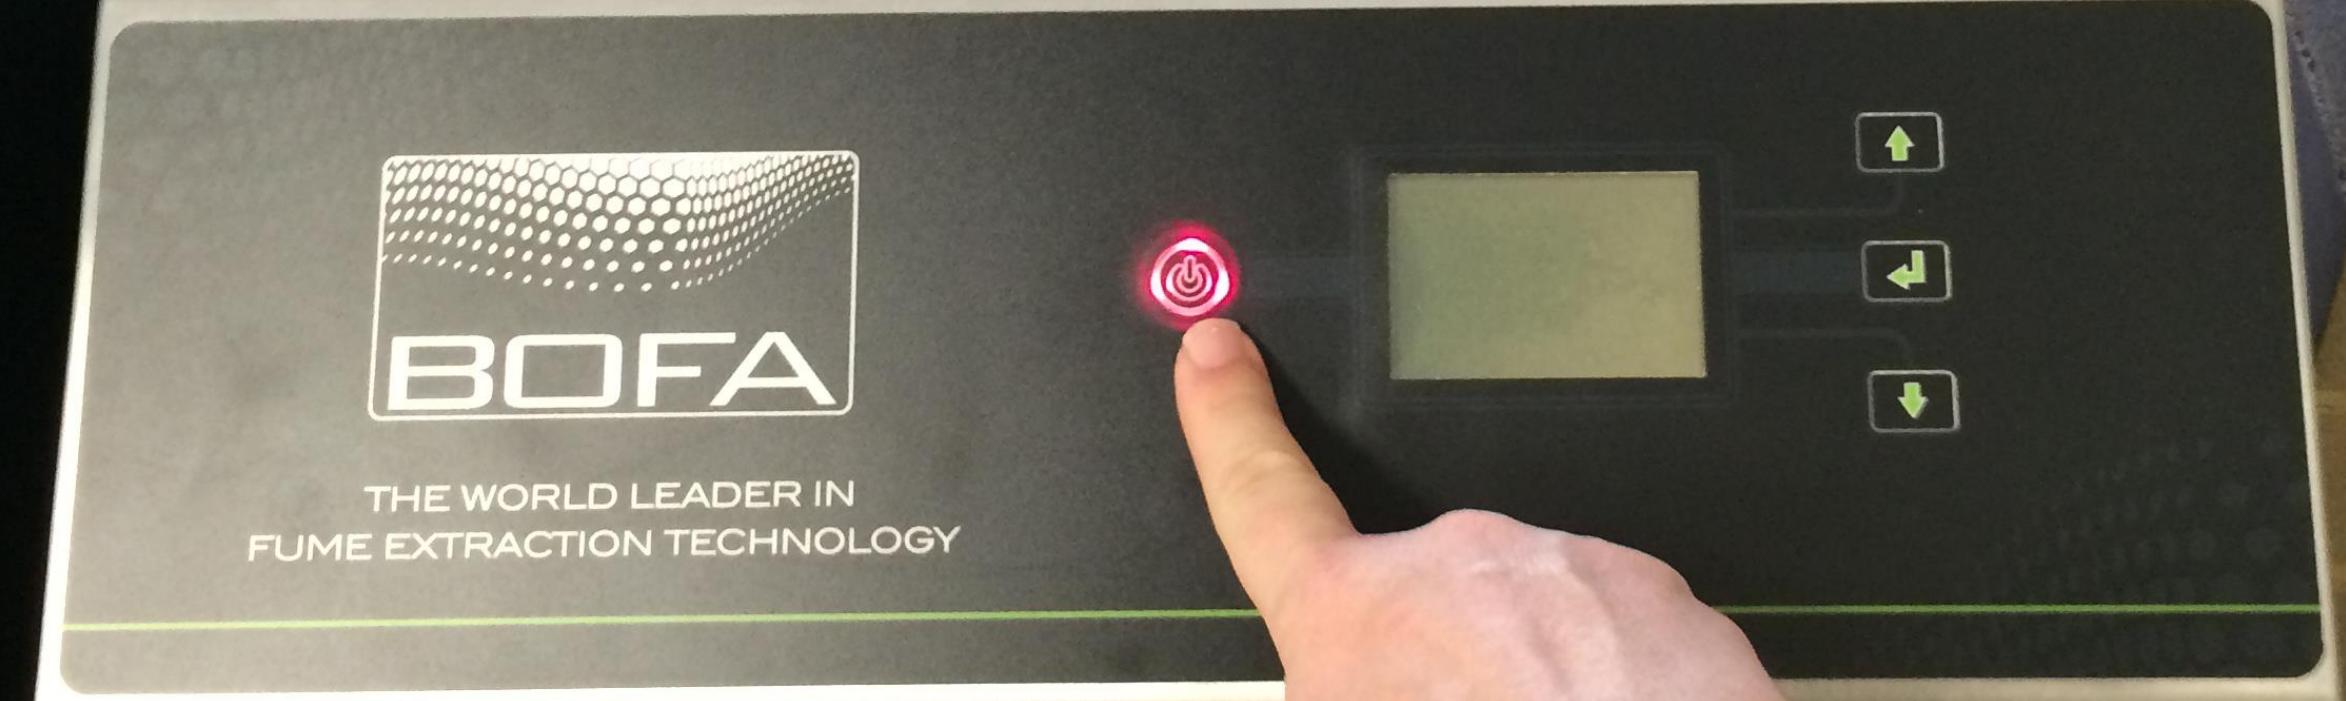

Estimated time is 1 minute
and 20 seconds... FAST!

CLOSE THE TOP. The laser will move around but not operate while it is open! Don't put your hands inside if things are moving.

Power on the fume extractor next to the laser you are using.

Copies: 0

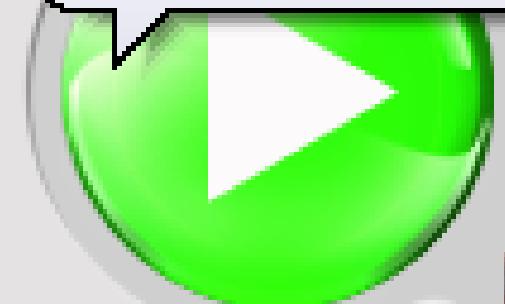

Runname:

0:00:00

20 21 22 23

Now hit the ginormous
START BUTTON.

Start engraving this print job.

Home xy

Home z

Once you start the job, **DO NOT**
LEAVE THE LASER UNATTENDED! If
the material you are cutting catches
fire, stop the job; if **YOU** need to put
out the fire. Know where the fire
extinguisher is!

If there is a small fire on the laser,
DON'T PANIC! It's contained in the
cutting chamber, so it shouldn't get out
of control. Get the lab tech: they will
decide if using the fire extinguisher is
necessary. **IF** for some reason you use
the fire extinguisher, the lab tech on duty
should call UPD and email Devin.

TIP: if your job takes a long time,
make sure the computer doesn't fall asleep. If the computer falls asleep the laser will shut down in the middle of the job and you will have to restart from the beginning. Move the mouse every few minutes.

Starting to cook!

We have a laser, now we
need to purchase a shark.

A minute-and-a-half later!

After the job is done, wait 30-60 seconds before opening the top.

This gives the system time to vent any fumes and allows your material to cool.

A close-up photograph of a person's hand pointing their index finger towards a white rectangular piece of paper. The paper is resting on a dark, textured surface, possibly a desk or chair. The background is slightly blurred, showing some blue and black colors.

We have a laser, now we
need to purchase a shark.

DONE!

CLEAN UP!!!!

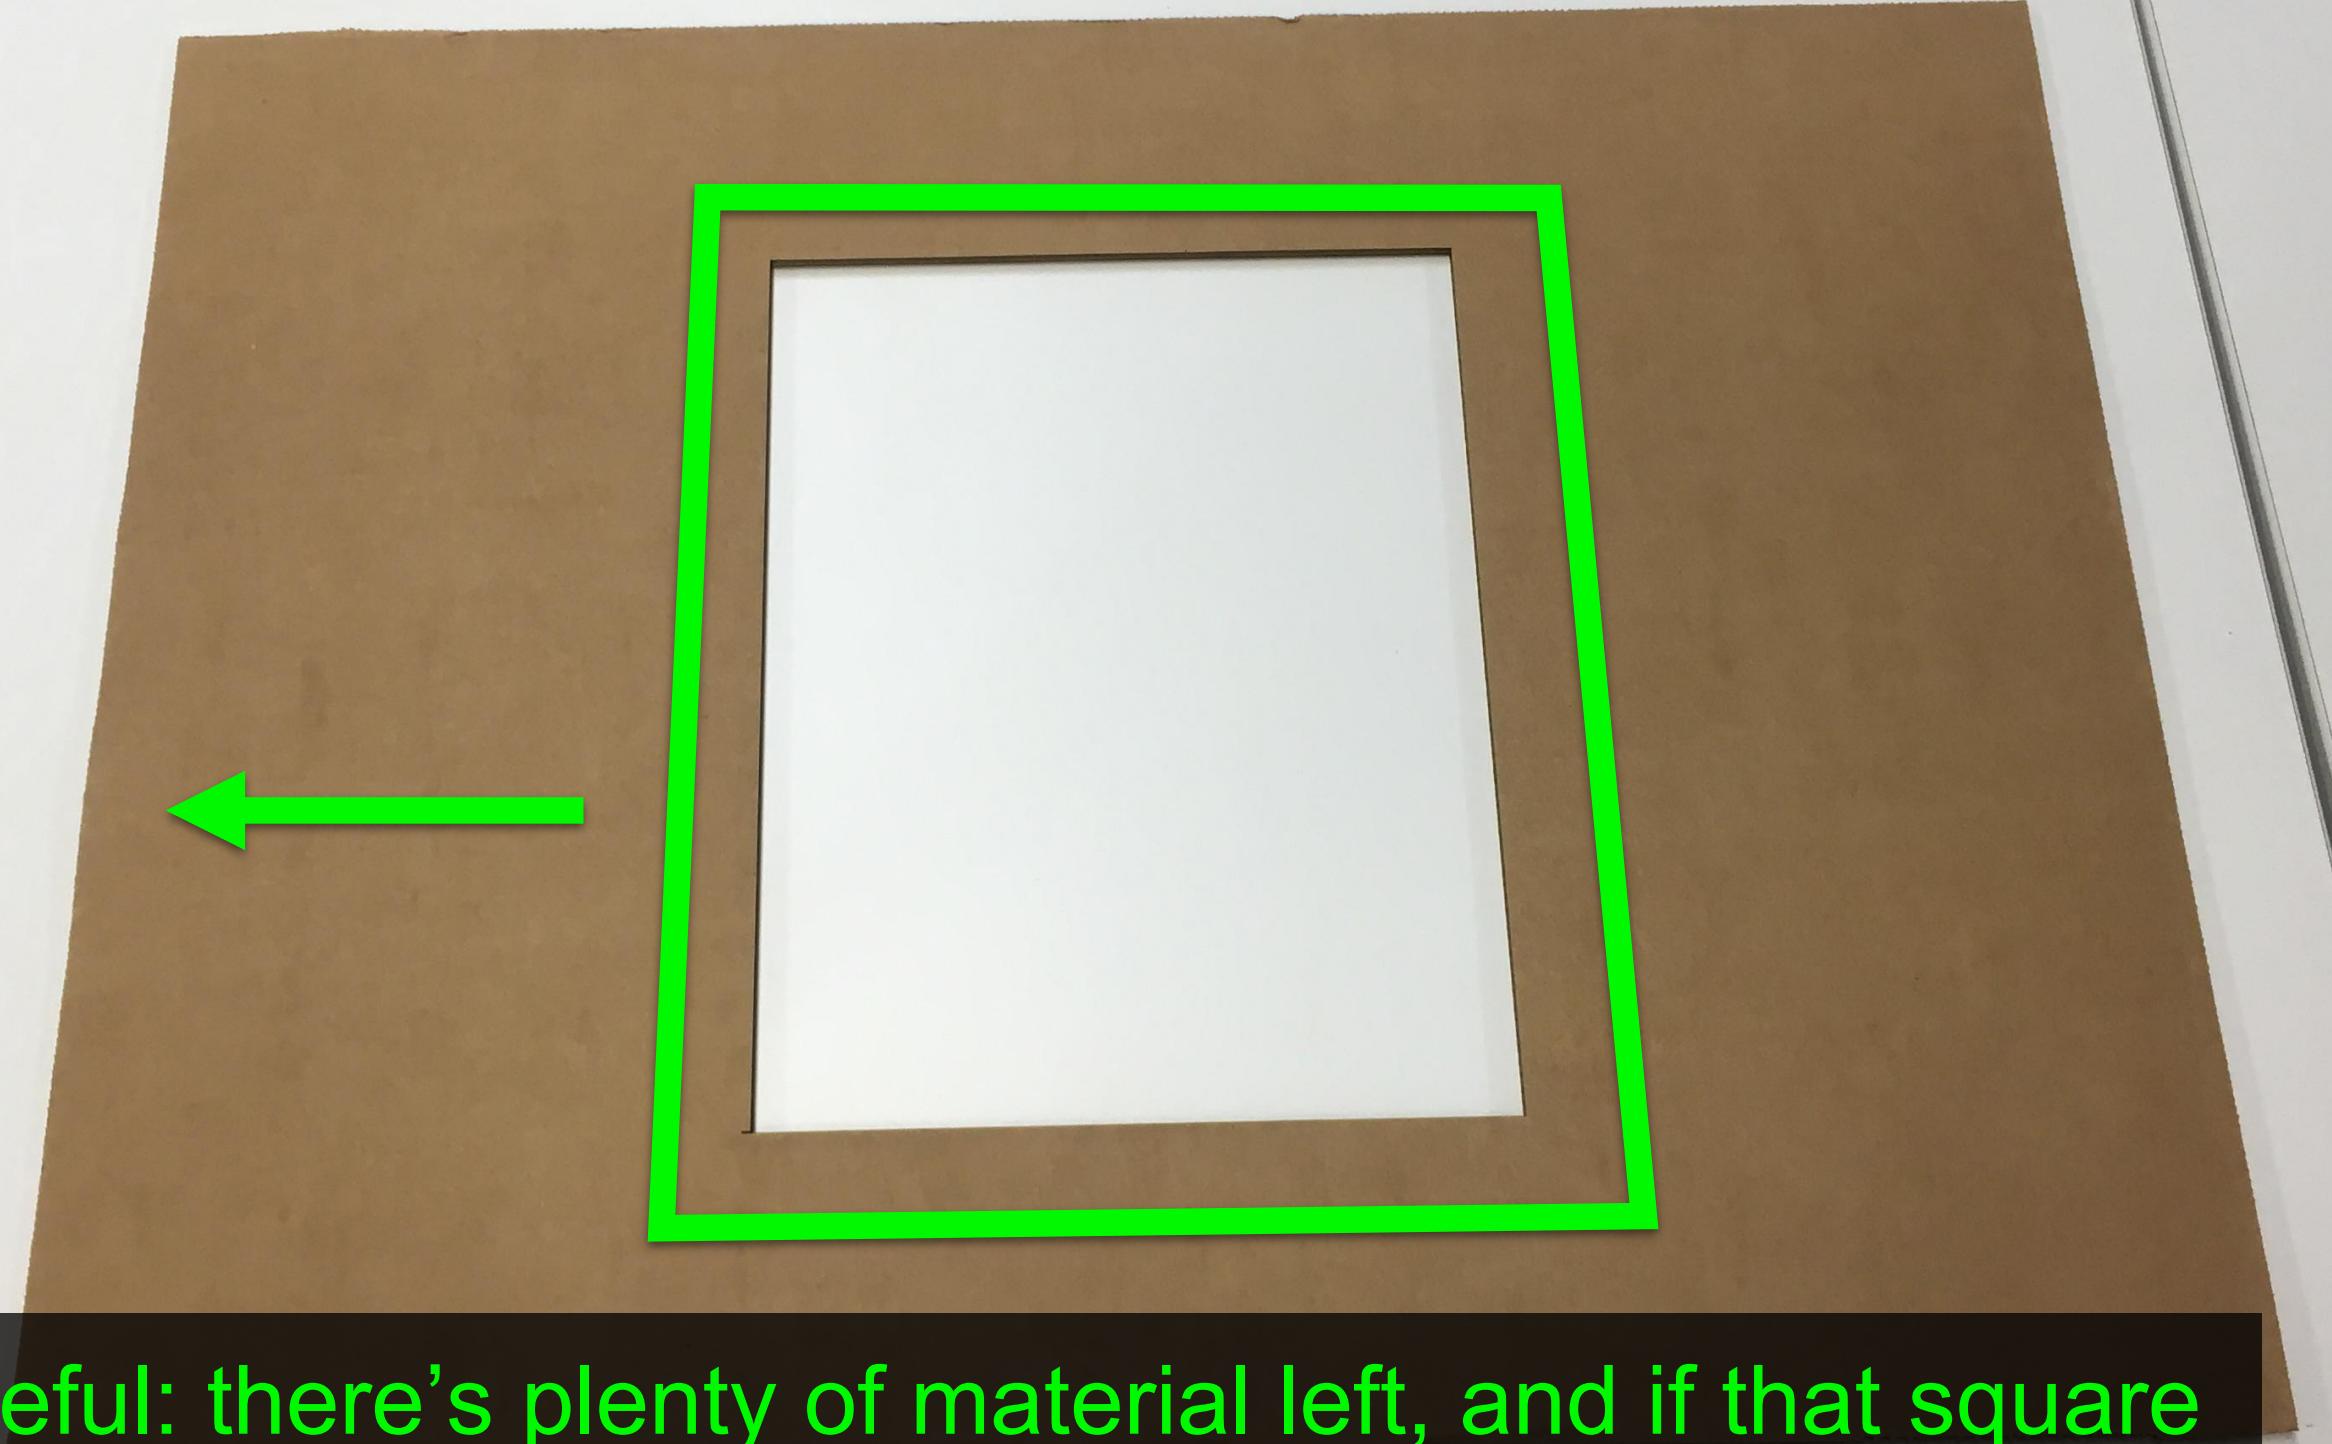

This is AWFUL. Never leave materials lying around,
ESPECIALLY not on top of equipment.

If you only used less than half of the sheet, save the rest, rather than throwing out. We have a pile for cardboard and can make piles for chip board, etc. But...

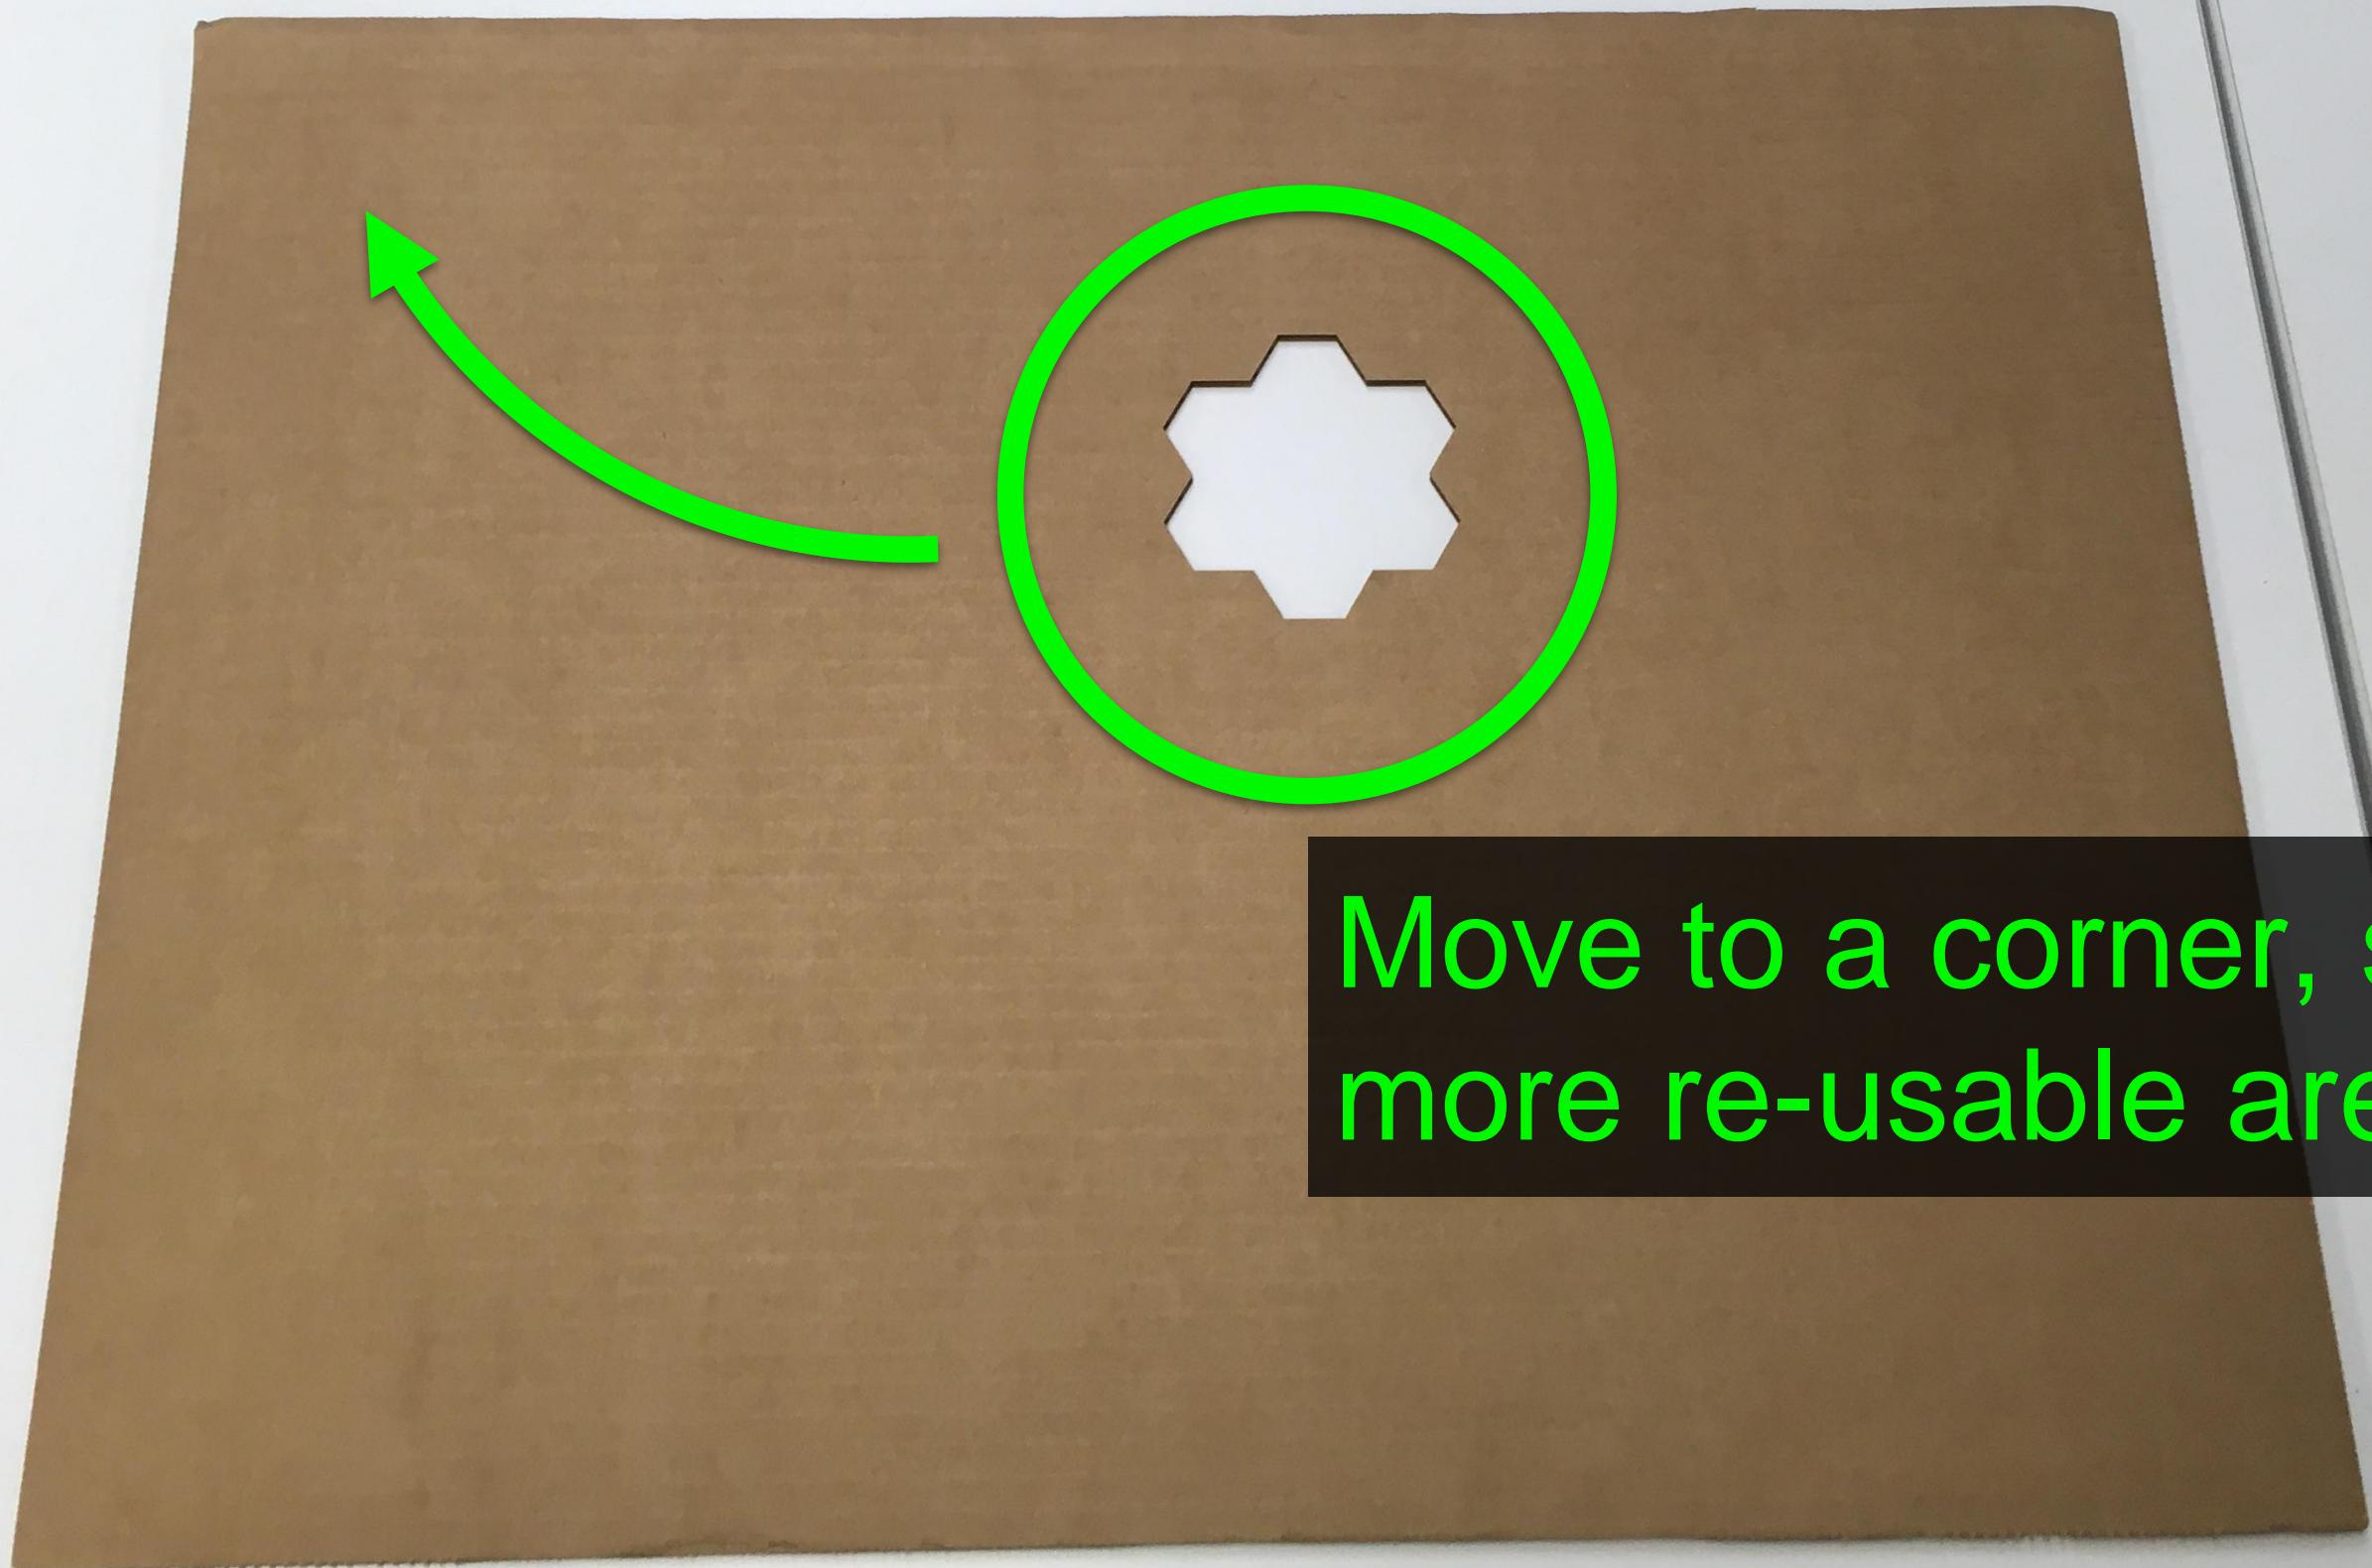

I see sheets like this in the pile
ALL THE TIME. Really? Trash.

This is wasteful: there's plenty of material left, and if that square had been cut on one end, rather than the center, there would be a larger re-usable space.

Good grief.

Move to a corner, so
more re-usable area.
